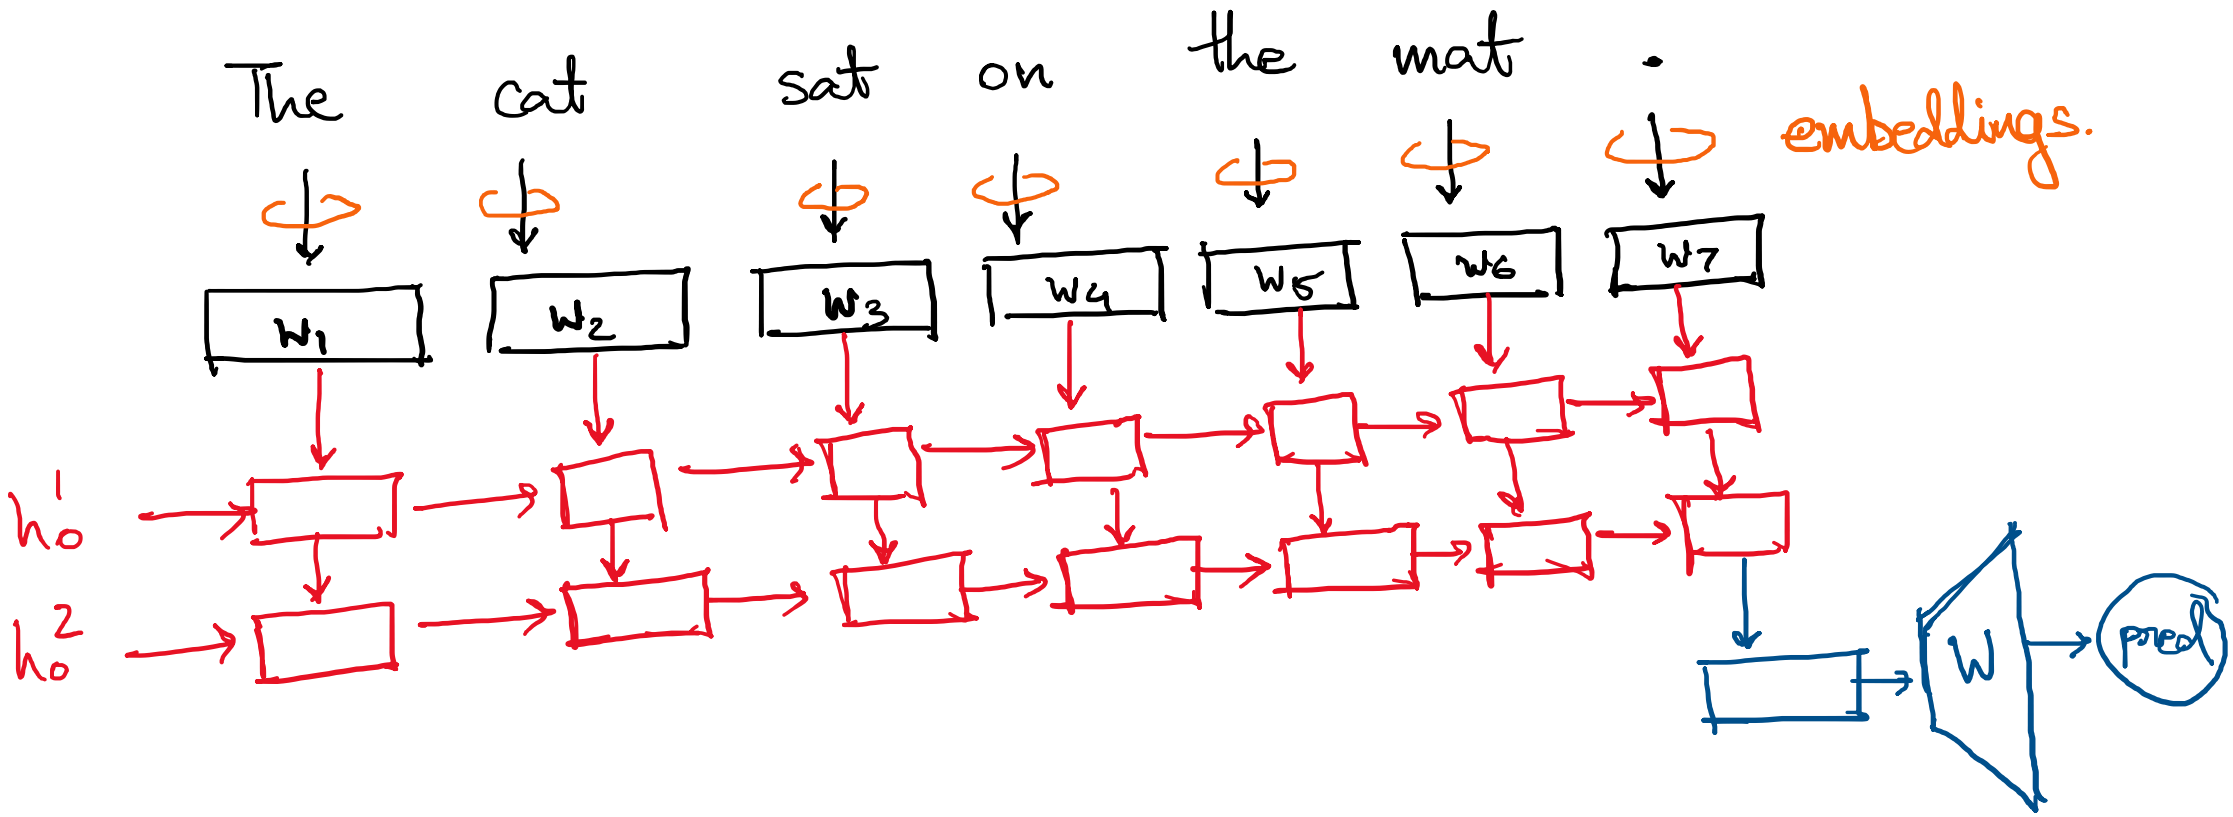
BERT & other Transformer-based language models: an overview

Soham Pal.

27th May 2020

The need for embeddings



Word embeddings must capture:

1. Complex characteristics of word use
   - → syntax
   - → semantics
2. How these uses vary across linguistic contexts
   - → polysemy.

Word Embeddings: a timeline.

1. Classical → Latent semantic analysis
2. Neural (basic) → word2vec, skip-gram [Mikolov]
   GloVe

context independent

3. BiLSTM → ELMo

4. Transformers → GPT, → OpenAI
   BERT, → Google AI
   GPT-2 → OpenAI.

context dependent

Overall framework.

1 - Semi-supervised training on large amounts of text (books, wikipedia..etc).

The model is trained on a certain task that enables it to grasp patterns in language. By the end of the training process, BERT has language-processing abilities capable of empowering many models we later need to build and train in a supervised way.

Semi-supervised Learning Step

Model:

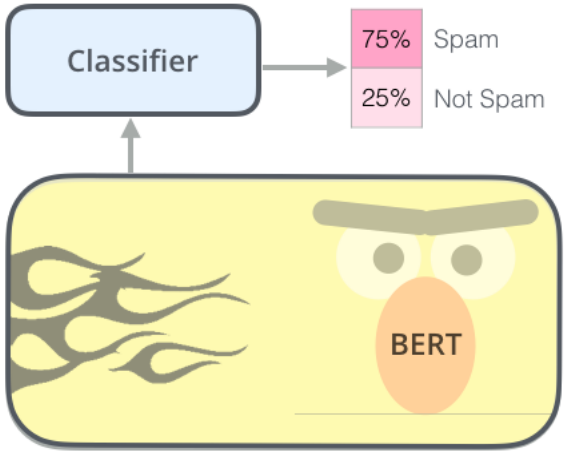
Dataset:

Objective:

Predict the masked word
(langauge modeling)

2 - Supervised training on a specific task with a labeled dataset.

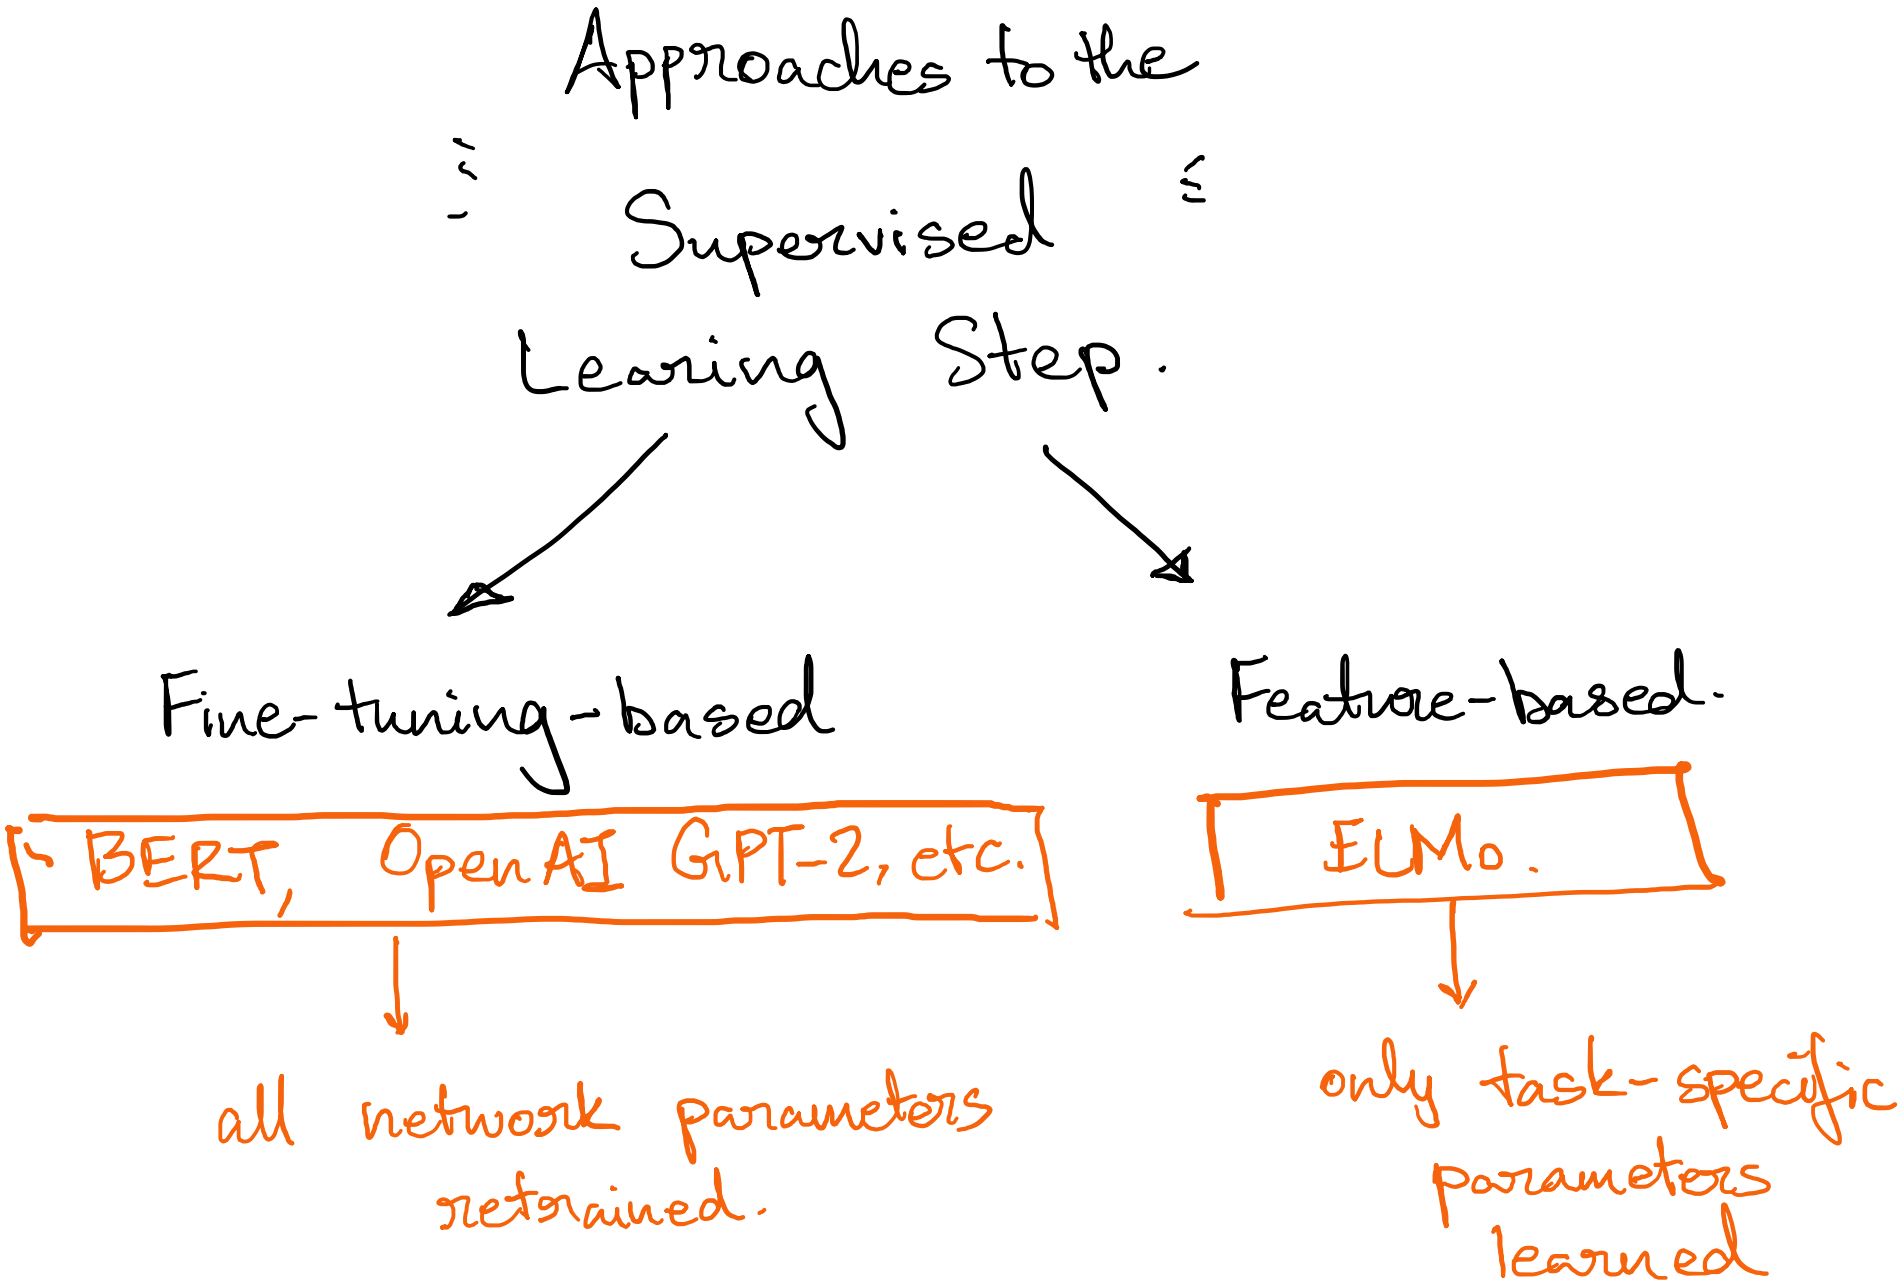
Supervised Learning Step



Model:
(pre-trained
in step #1)

Dataset:

Email message	Class
Buy these pills	Spam
Win cash prizes	Spam
Dear Mr. Atreides, please find attached…	Not Spam

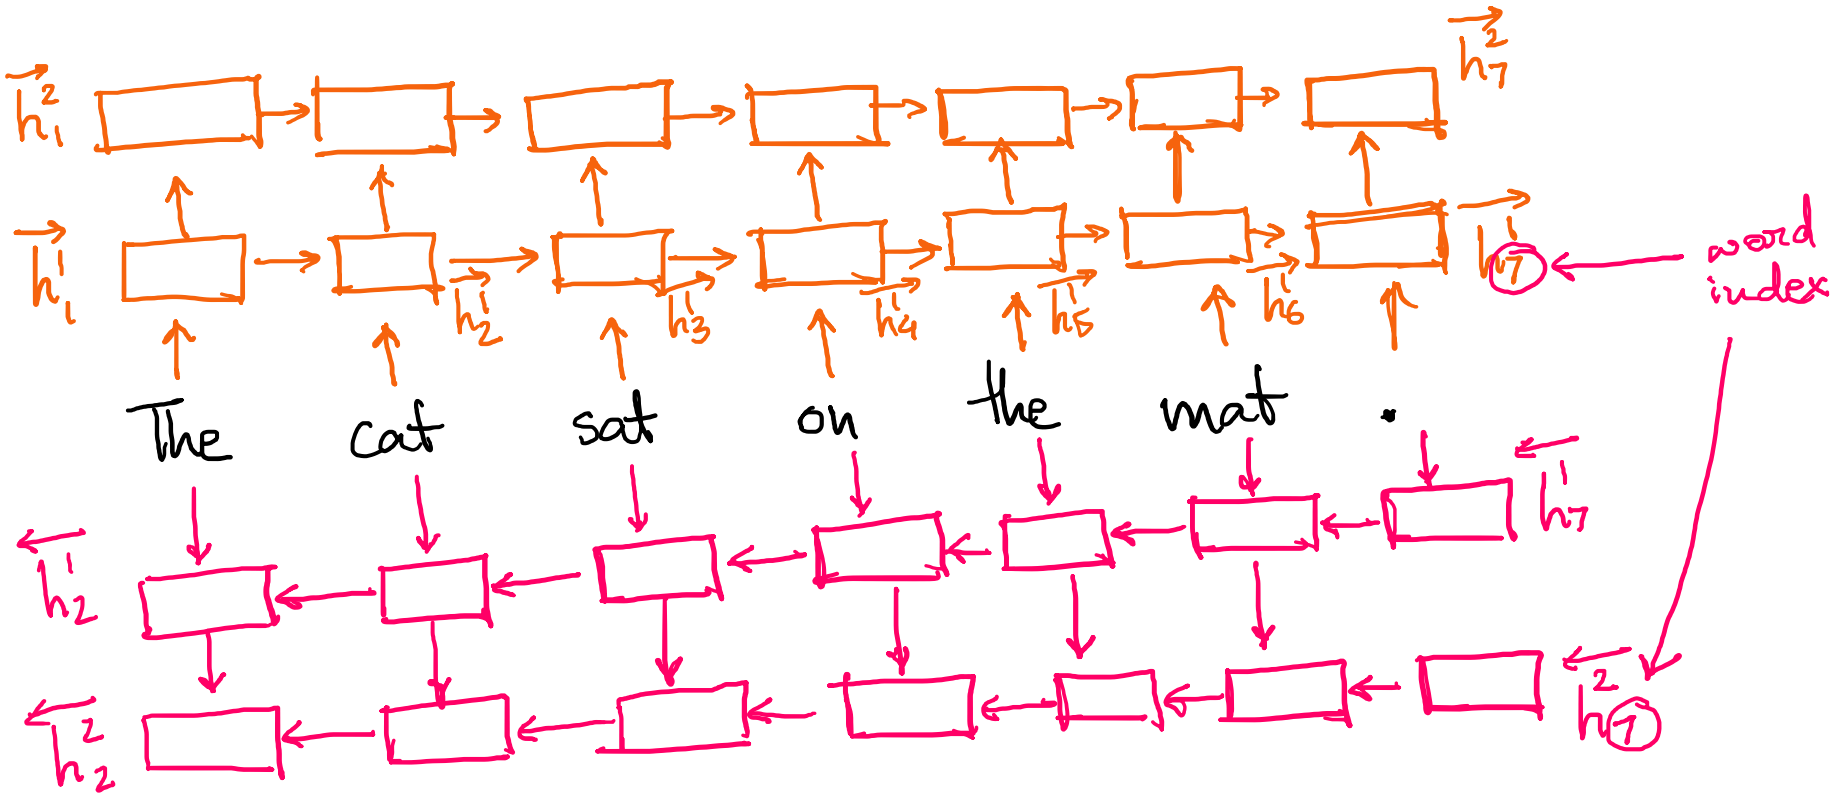


Approaches to the Supervised Learning Step.
Fine-tuning-based
BERT, OpenAI GPT-2, etc.
all network parameters retrained.
Feature-based.
ELMo.
only task-specific parameters learned

ELMo

→ start with large dataset (corpus: monolingual, unannotated).

→ train biLSTM language model.



ELMo (cont'd).

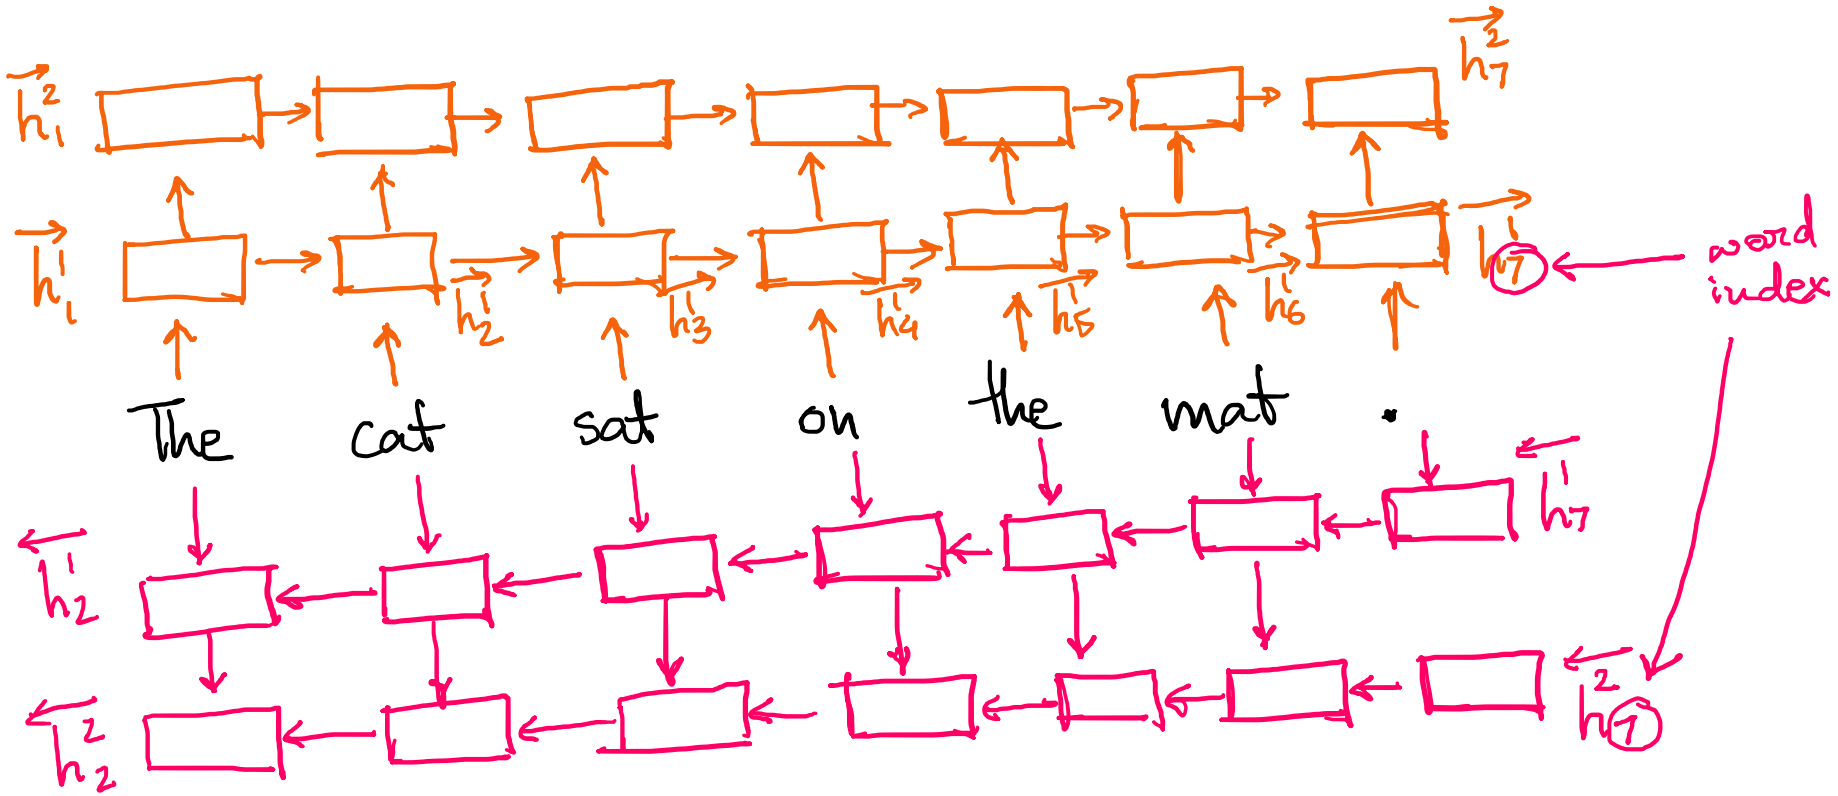
sum across layers.

$$\text{ELMO}_k = \lambda \left[\sum_{j=1}^{2} s_j \left[\overrightarrow{h}_{k}^{j}, \overleftarrow{h}_{k}^{j} \right] \right]$$

k: word index.

forward

backward.



ELMo (cot'd).

$$ELMO_k = \lambda \left[\sum_{j=1}^{2} s_j \left[\overrightarrow{h}_k^j, \overleftarrow{h}_k^j \right] \right]$$

(End of pretraining)

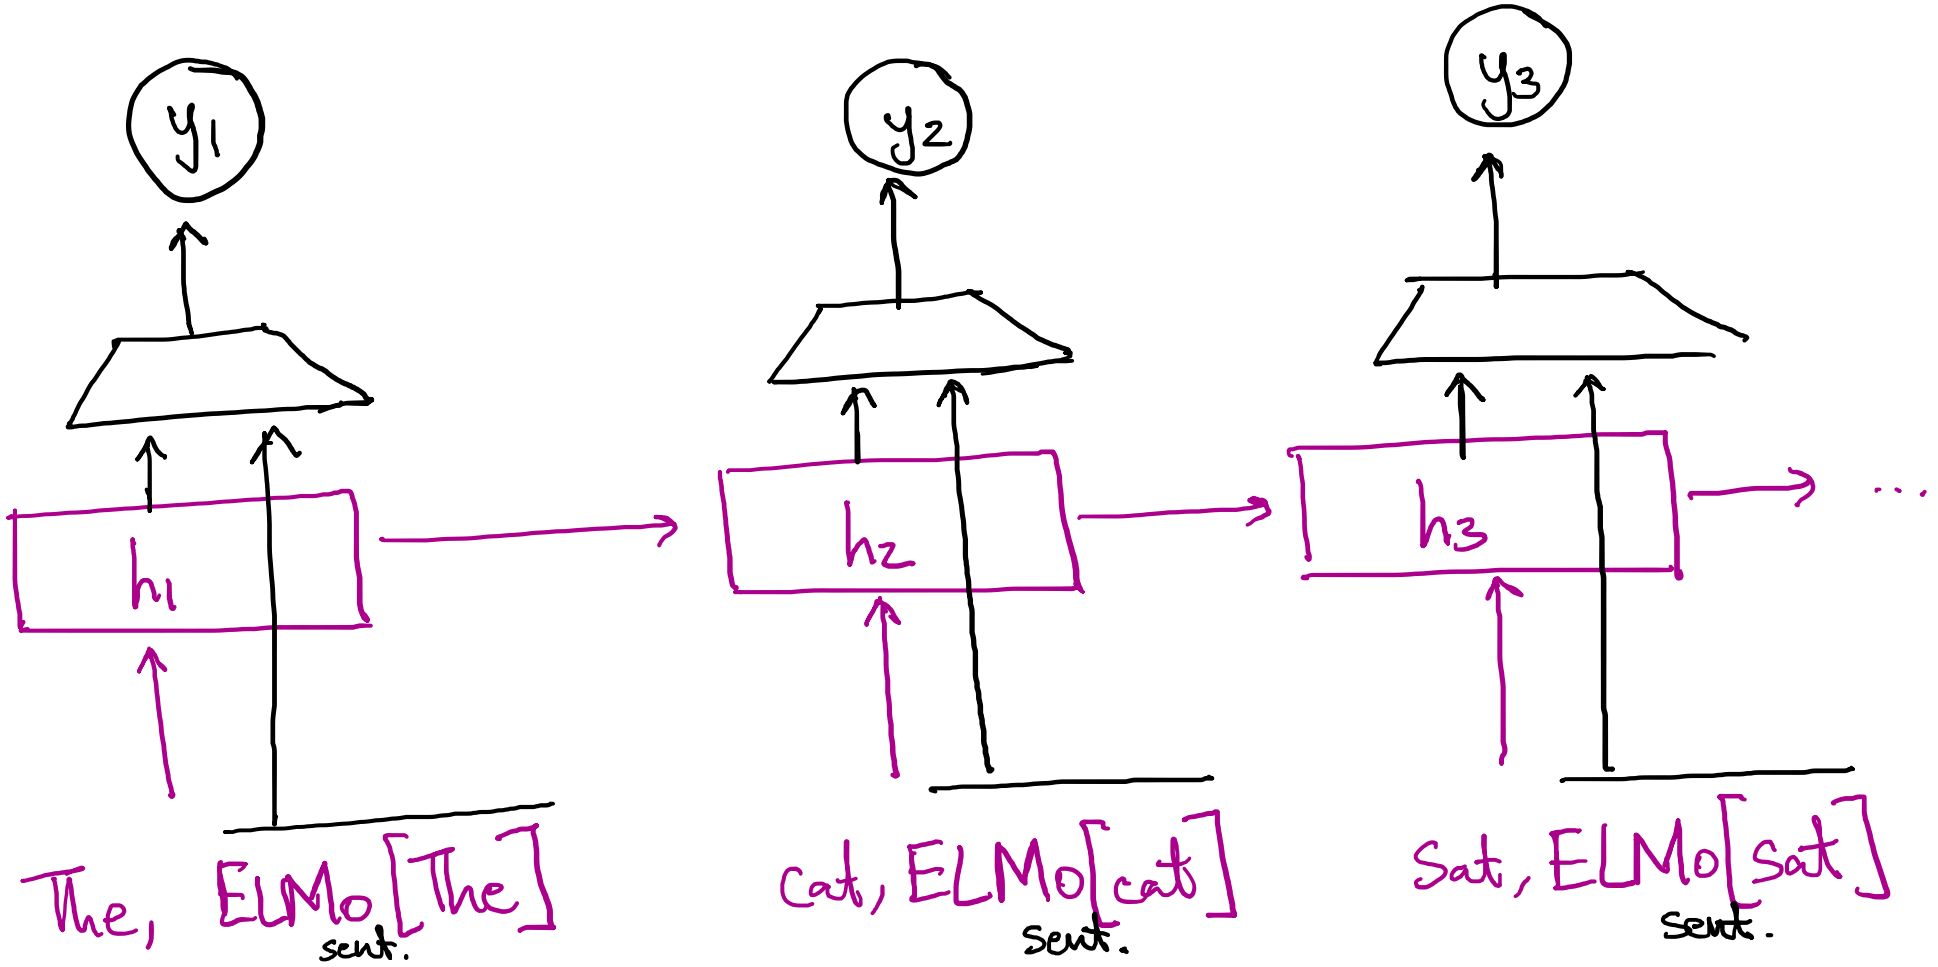
fwd propagation ONLY

backward propagation ONLY

⊗

No cross propagation of information.

ELMO: Task-specific training.



Freeze LM parameters, learn only λ and s.

Problems with ELMo:

→ basic architecture, trained on limited data.

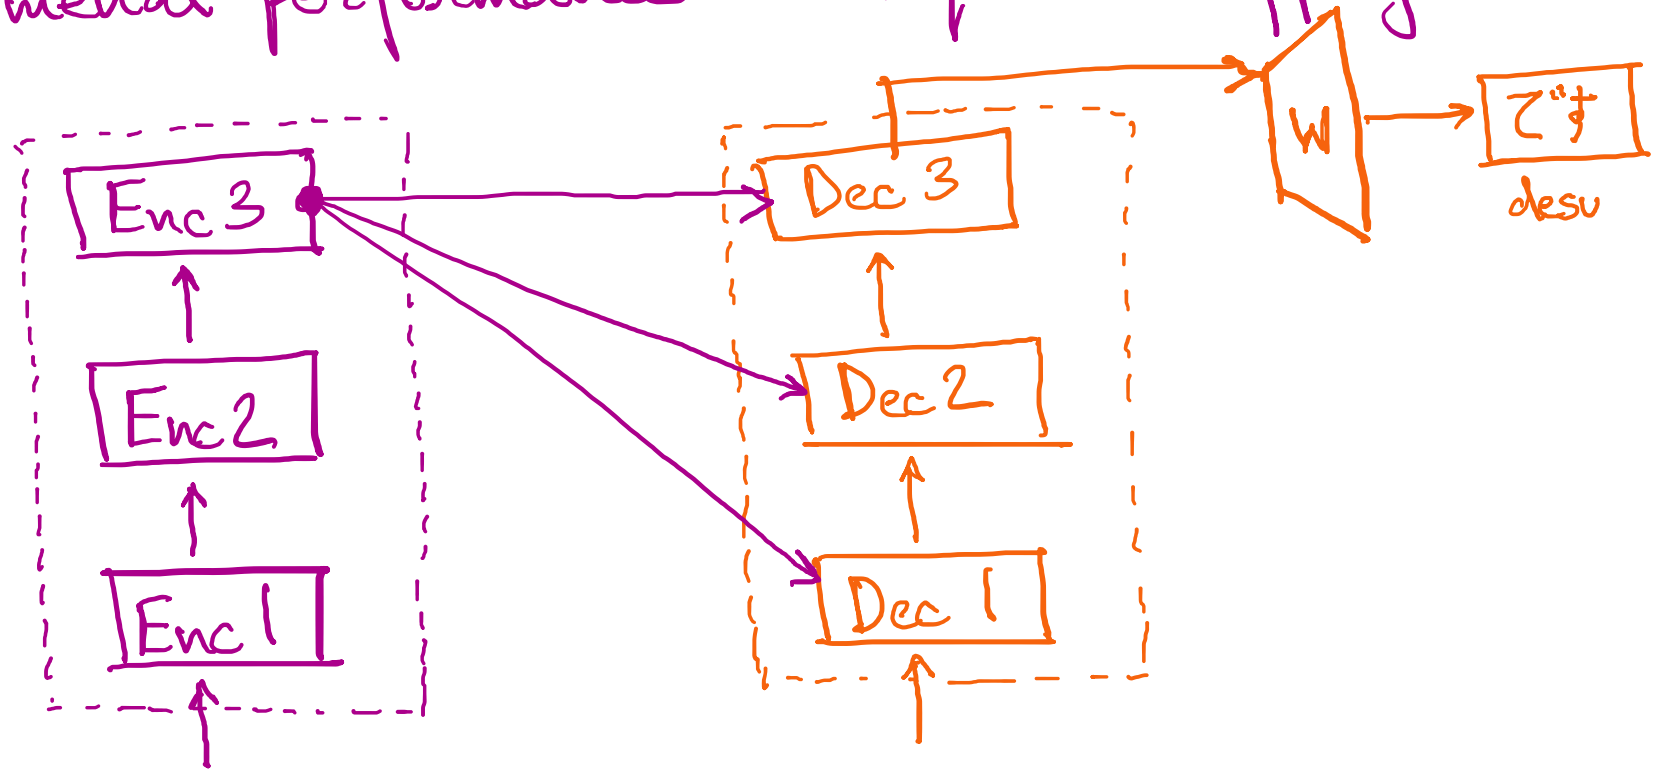
"Fixed" by GPT.

→ no mixing of information from both directions.

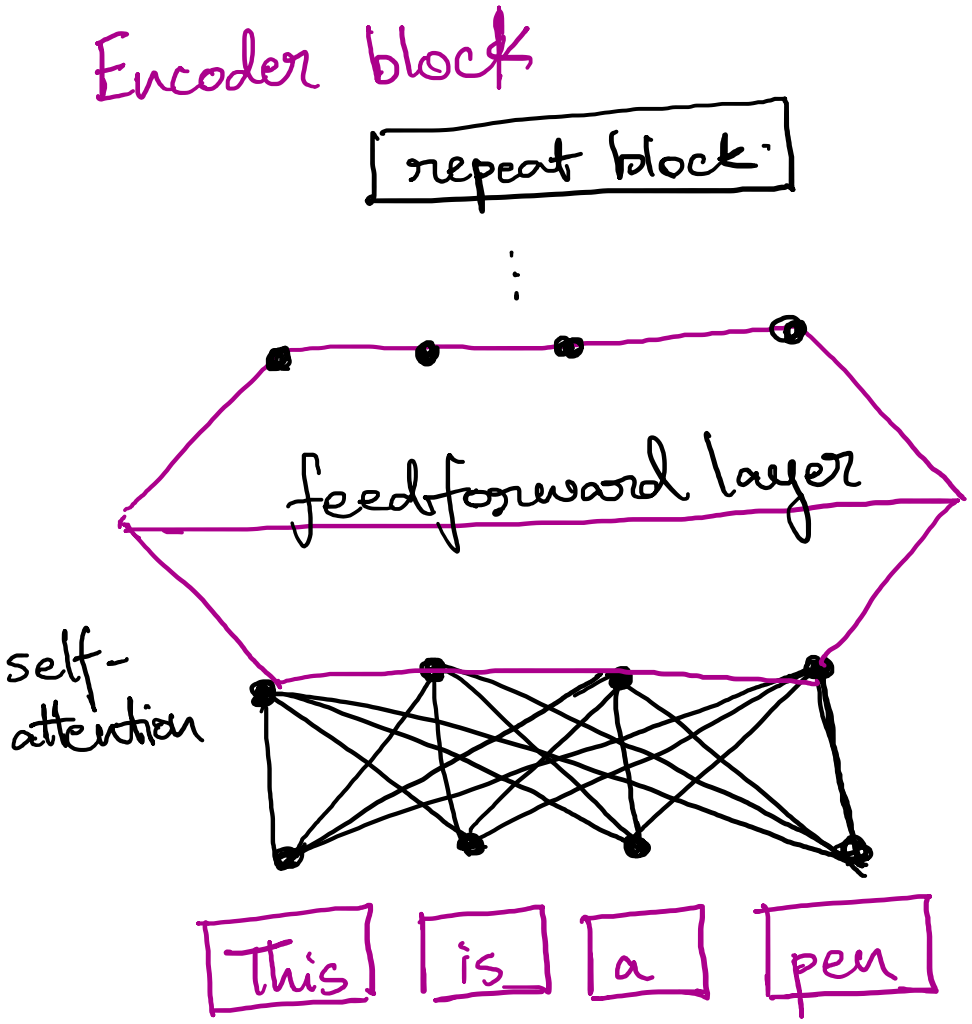
"Fixed" by BERT.

Recap: Transformers

→ Phenomenal performance on sequence-mapping tasks.

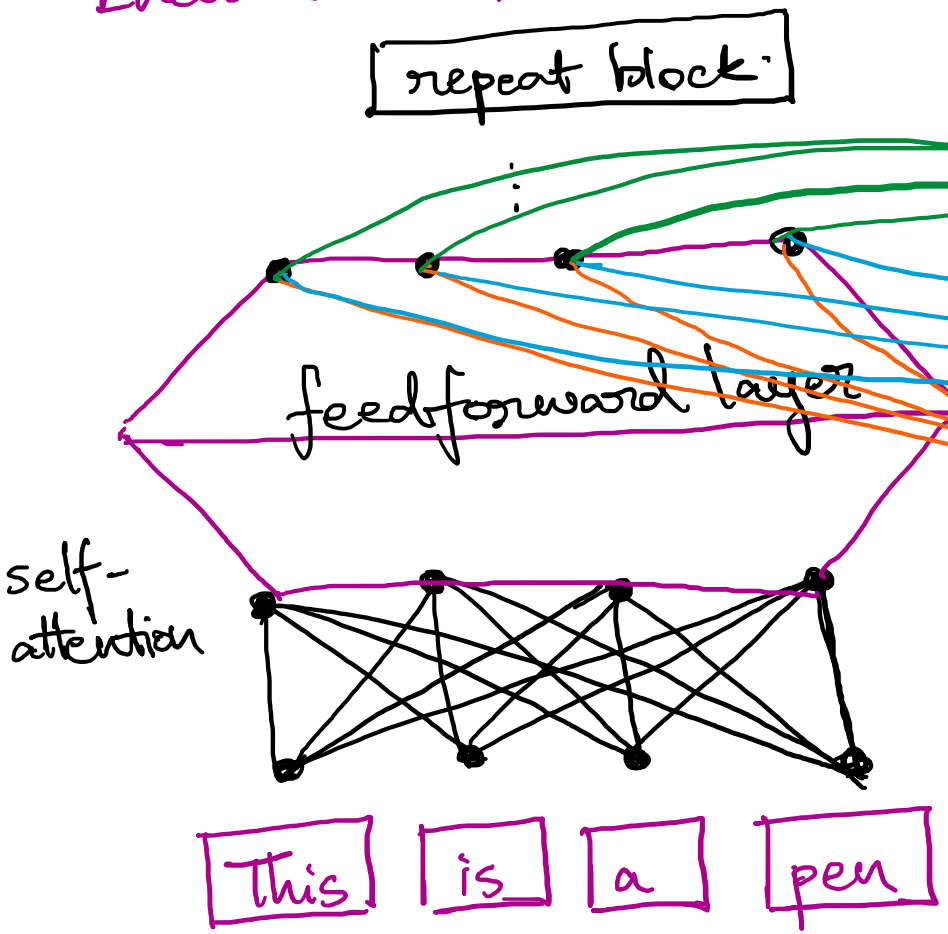


Recap: Transformers (cont'd).

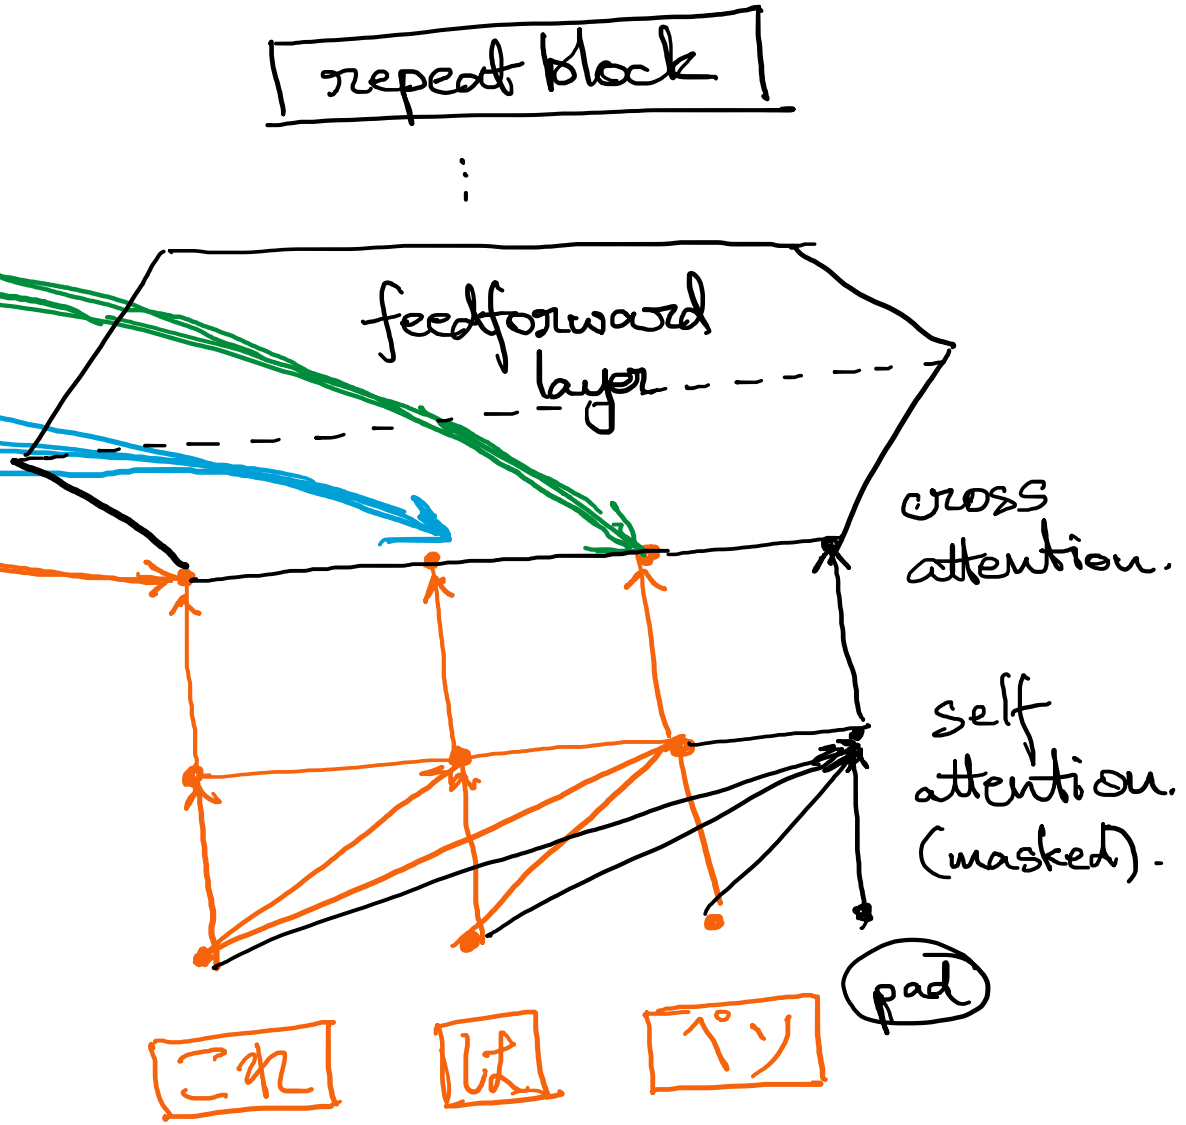


Recap: Transformers (cont'd).

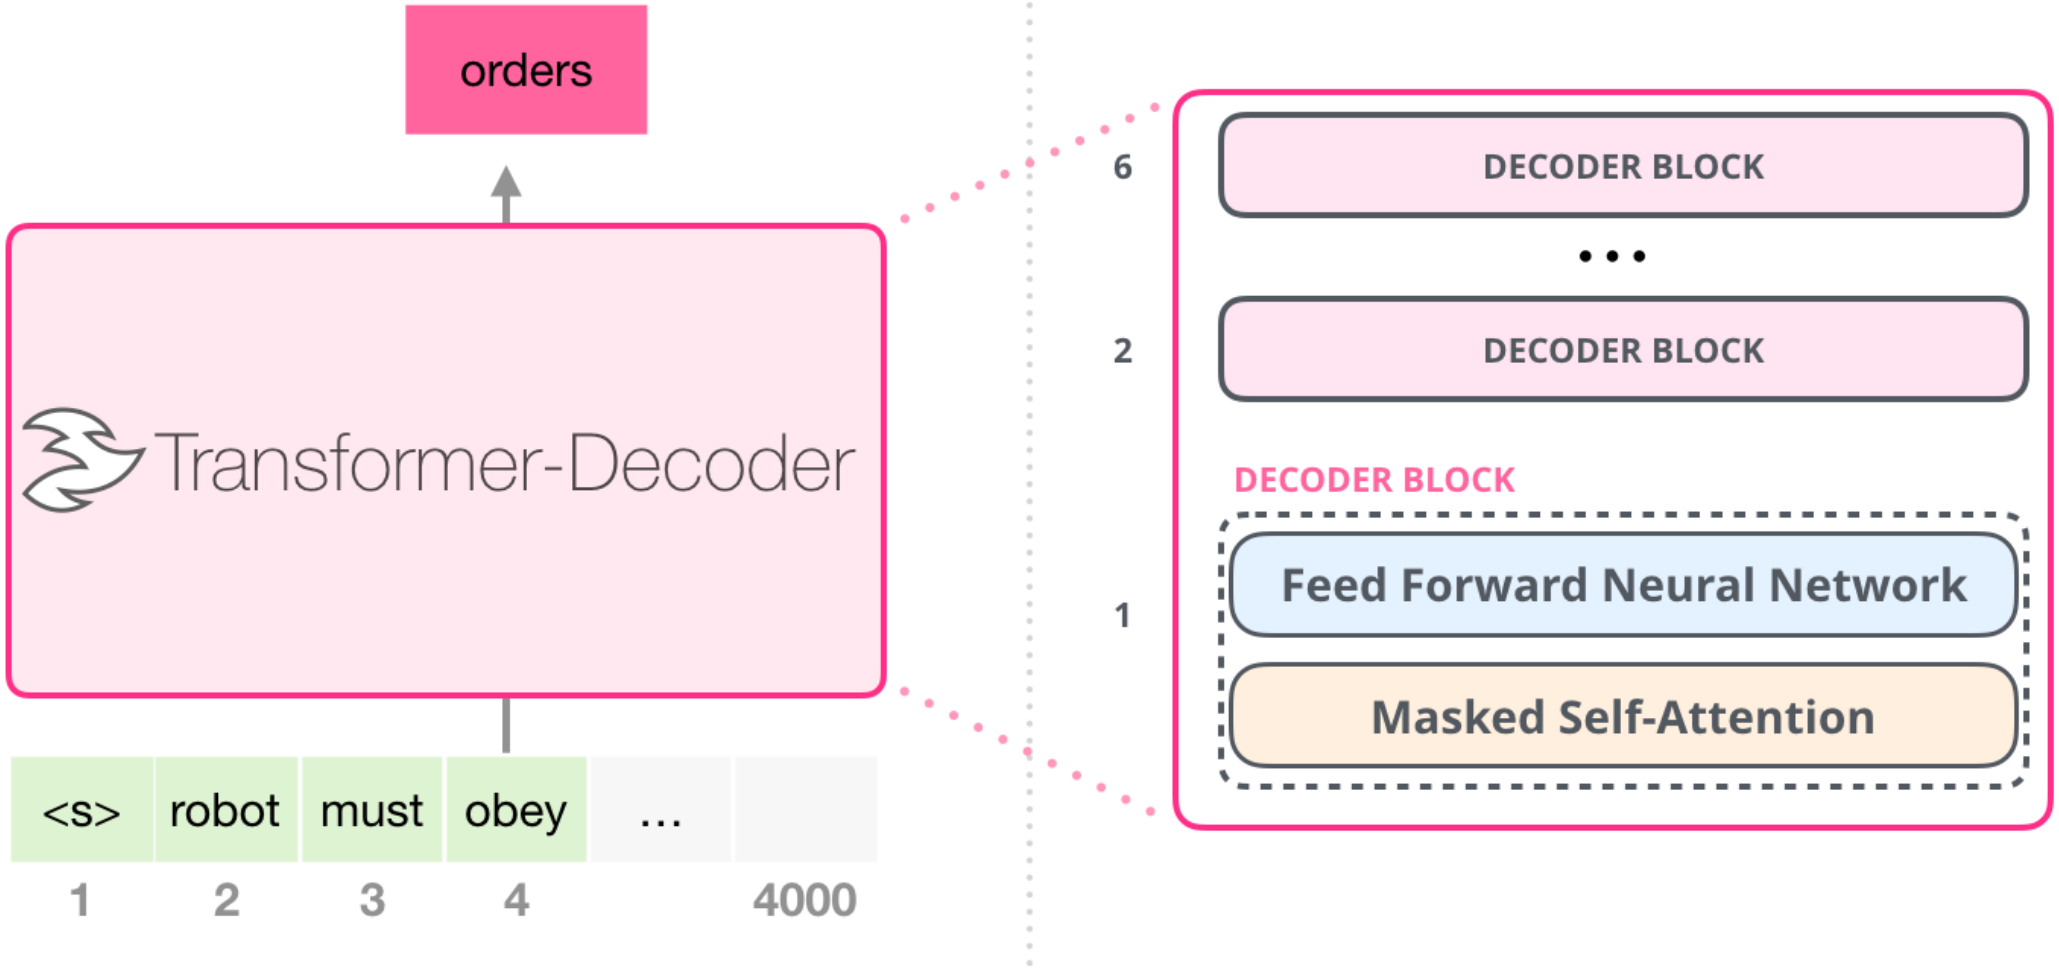
Encoder block



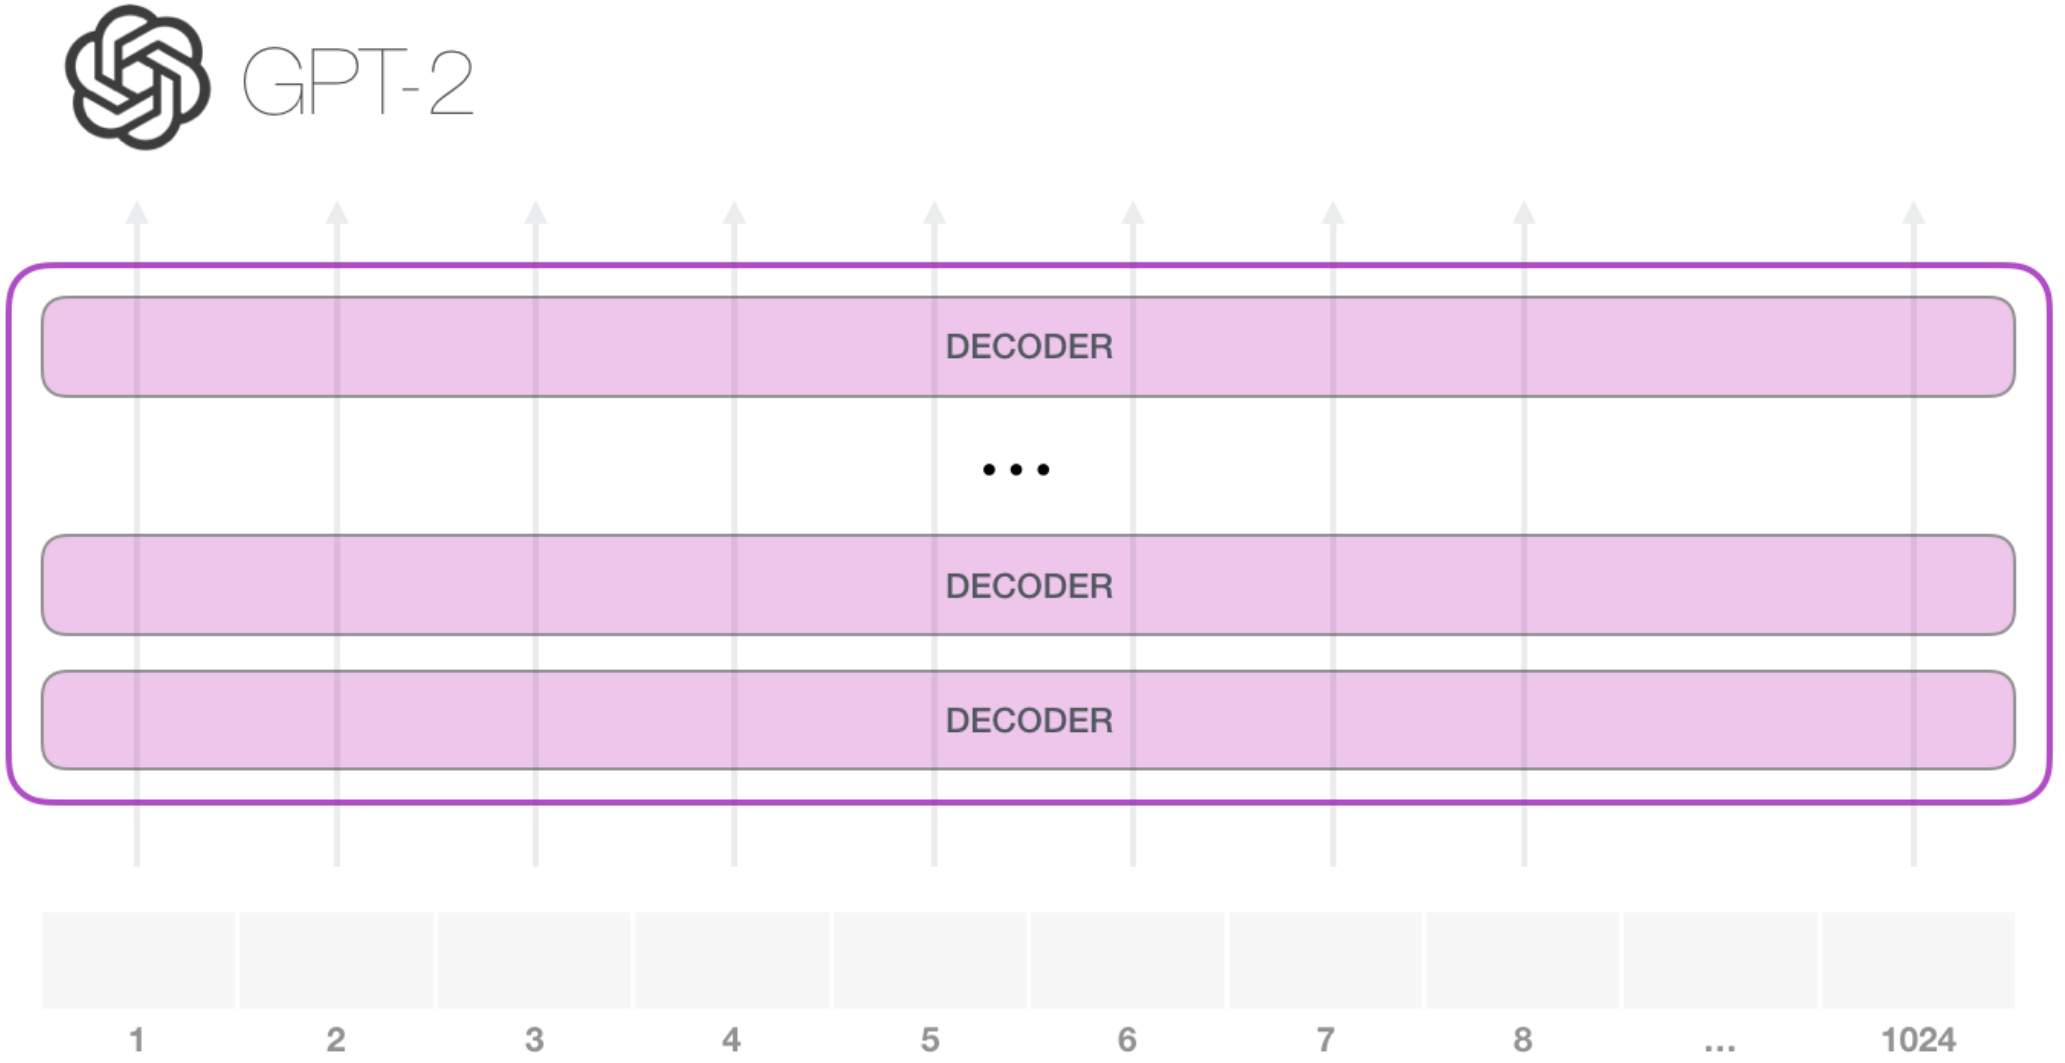
Decoder block.



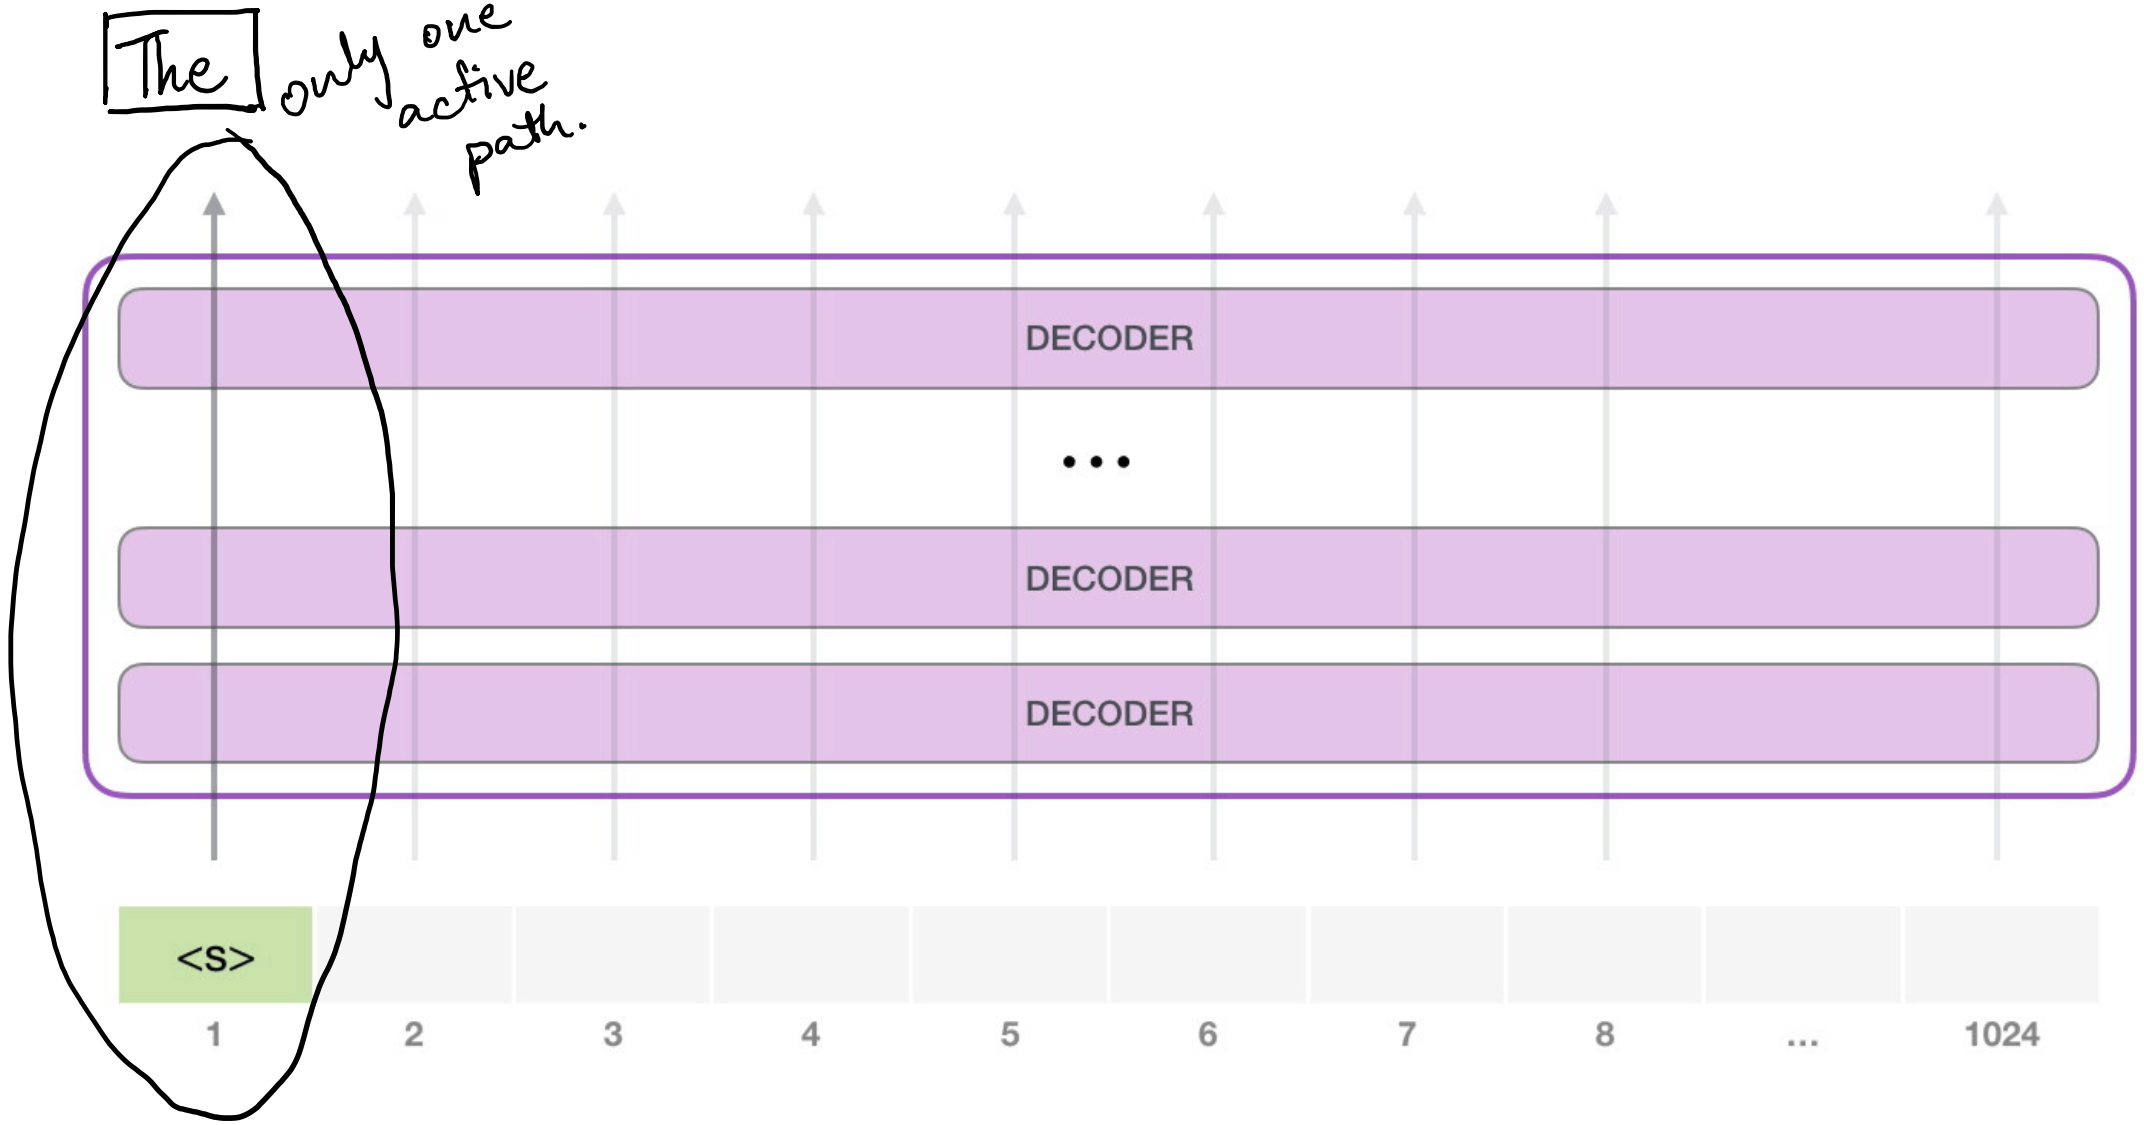
The new: TRANSFORMER-DECODER BLOCK.



The new: TRANSFORMER-DECODER BLOCK.

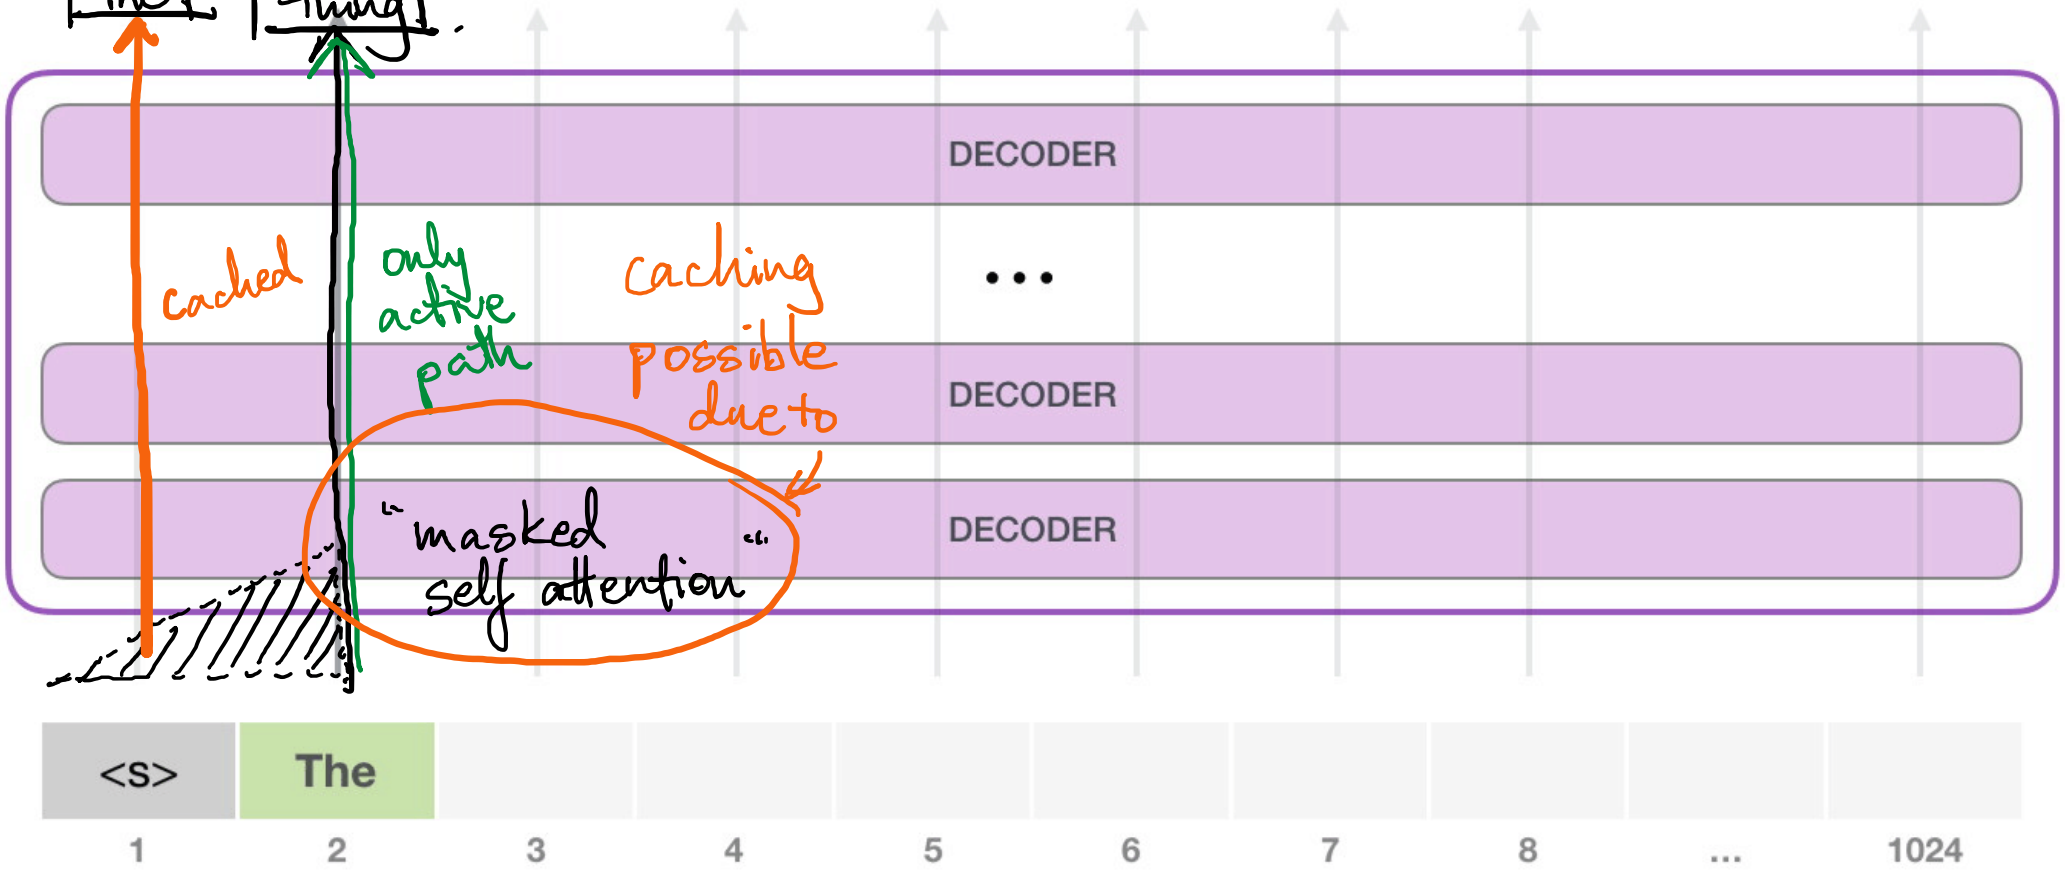


The new: TRANSFORMER-DECODER BLOCK.

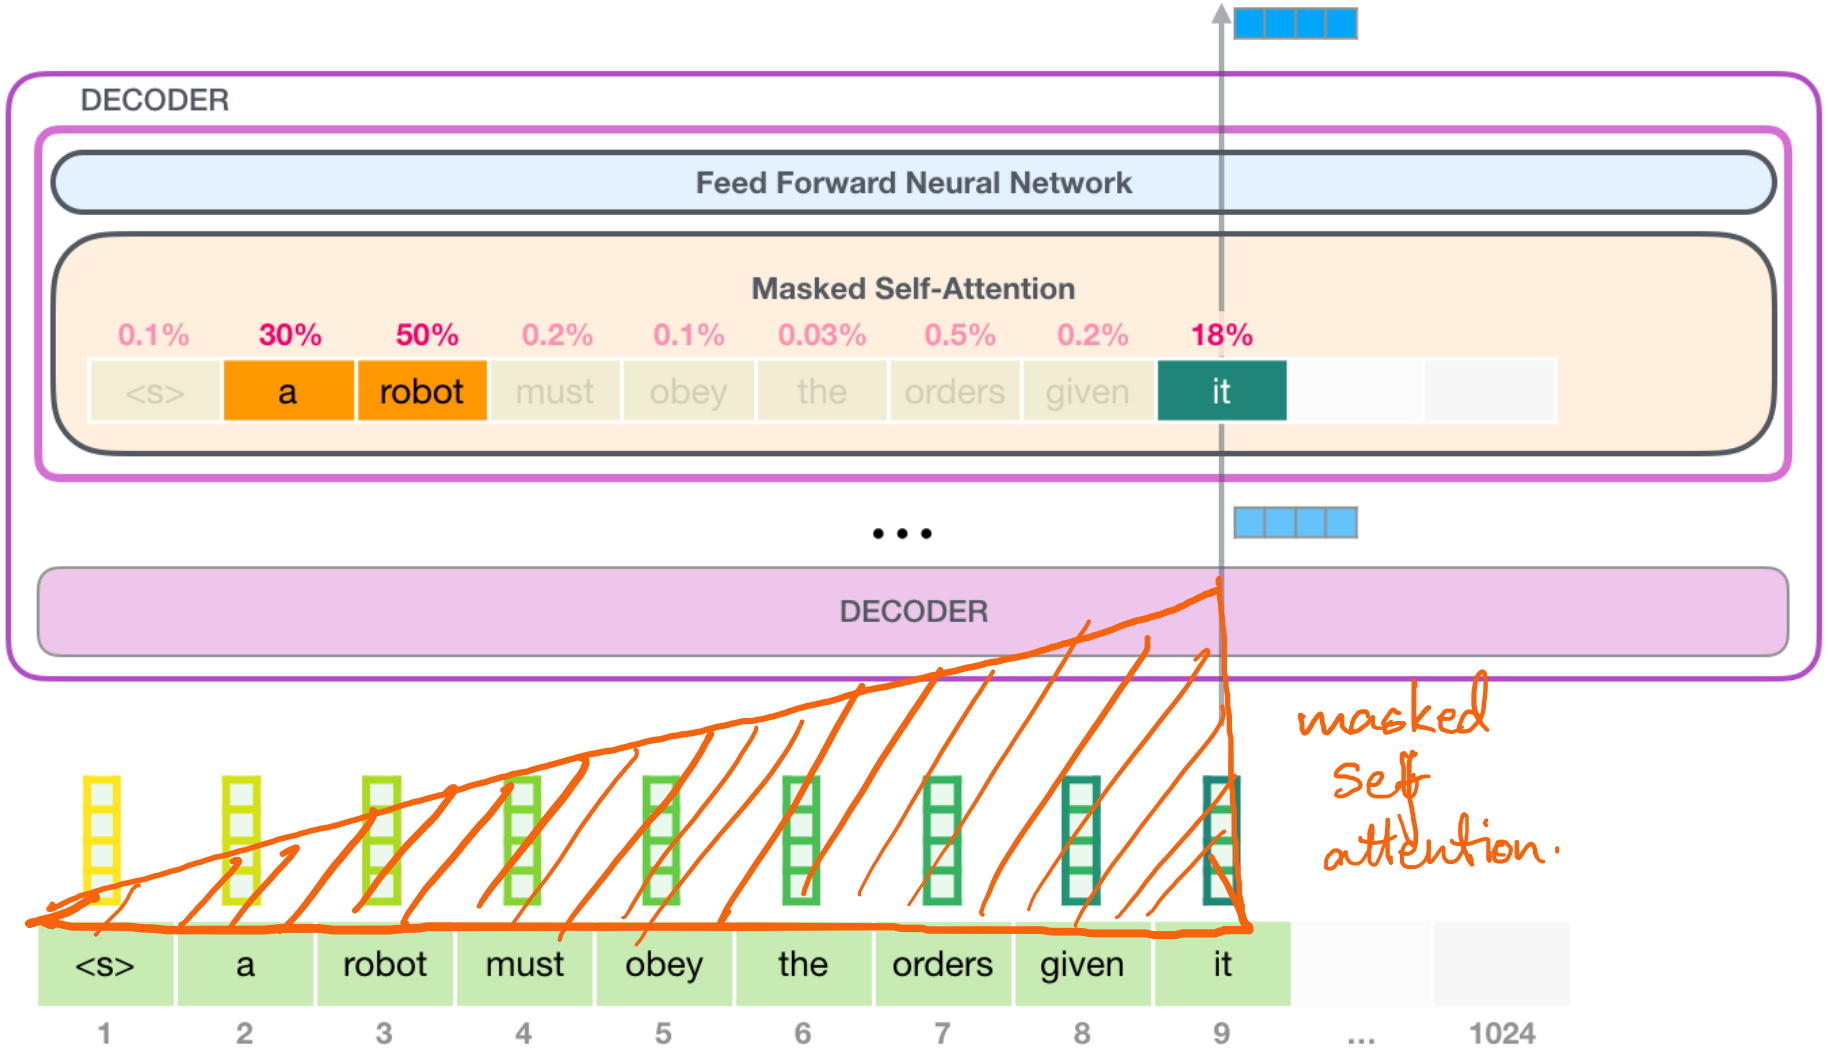


The new: TRANSFORMER-DECODER BLOCK.

Each layer of GPT-2 has retained its own "interpretation" of the first token & will use it in processing the second token.

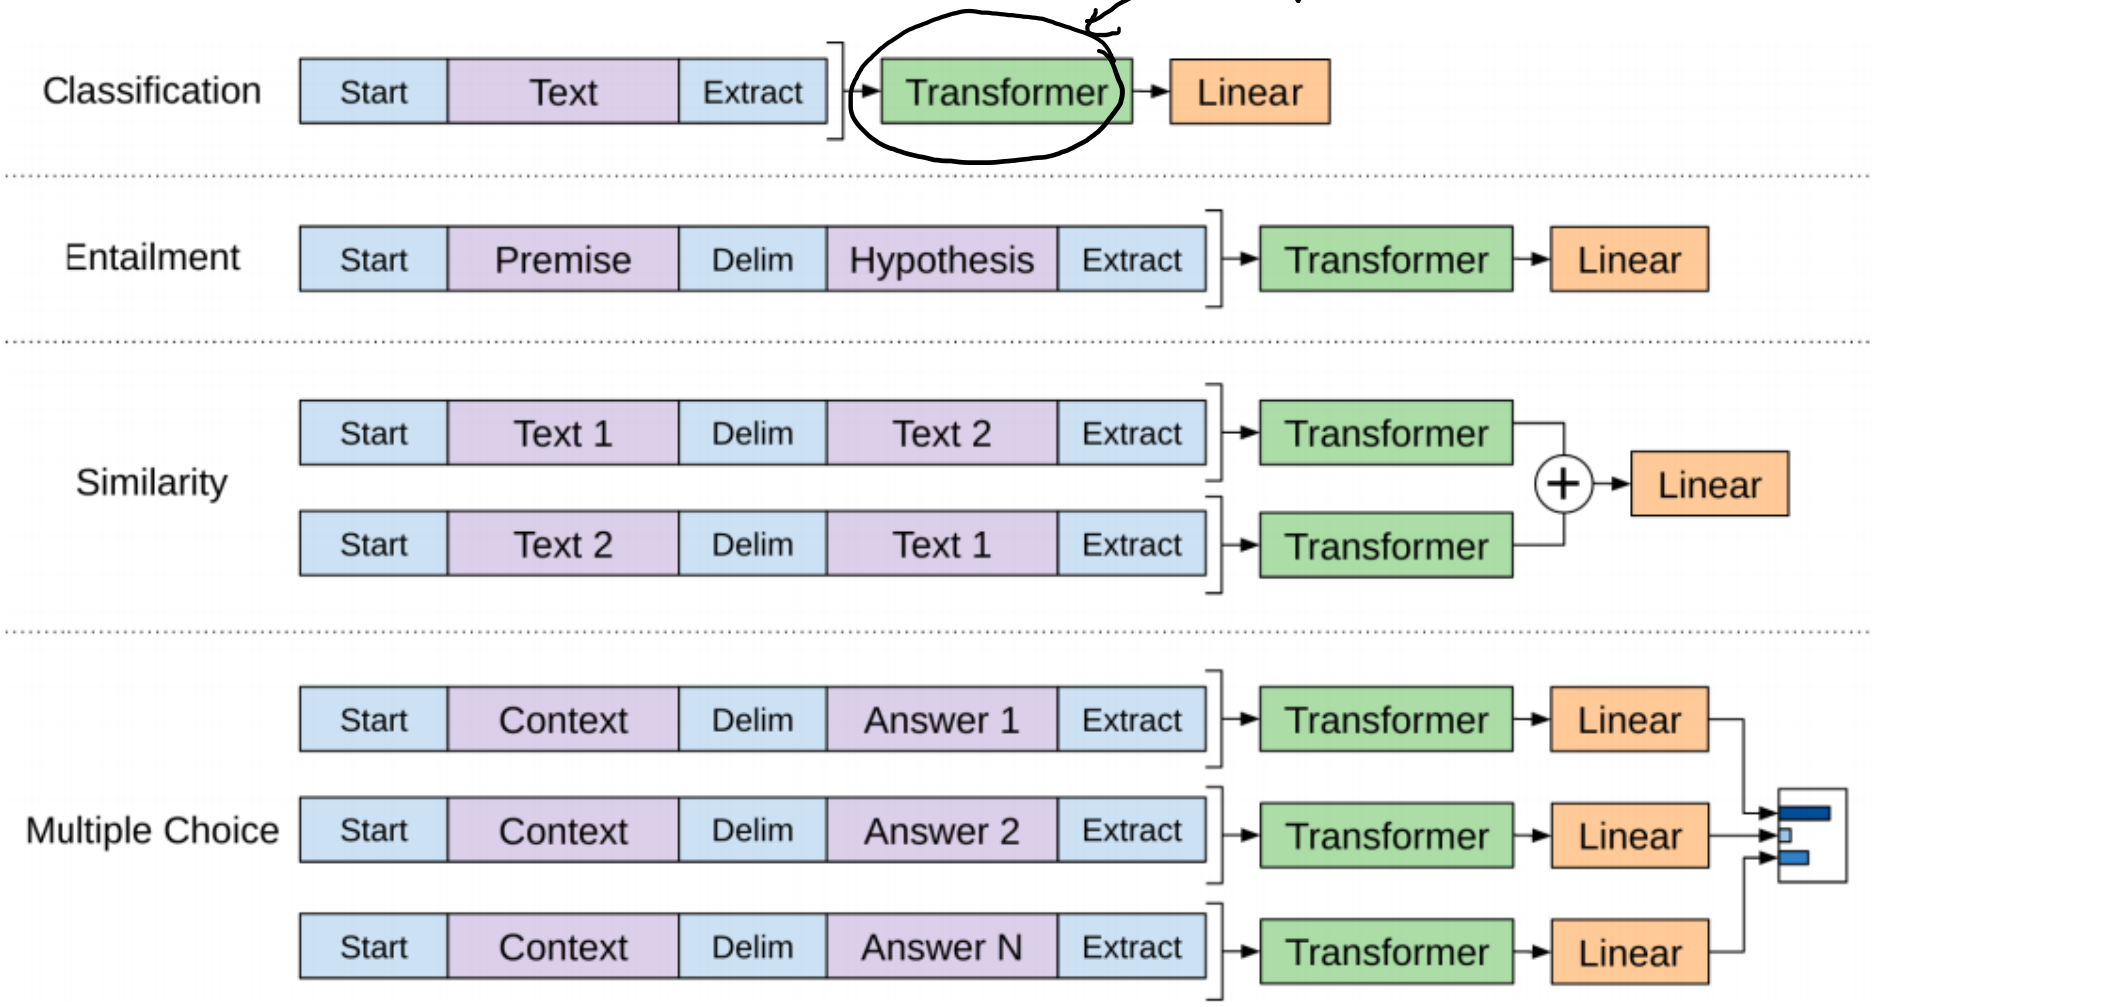


Peeling back the attention mechanism:



GPT: Putting it all together.

Transformer-decoder we just saw.



Results of GPT-1 vs. the then state-of-the-art.

Table 2: Experimental results on natural language inference tasks, comparing our model with current state-of-the-art methods. 5x indicates an ensemble of 5 models. All datasets use accuracy as the evaluation metric.

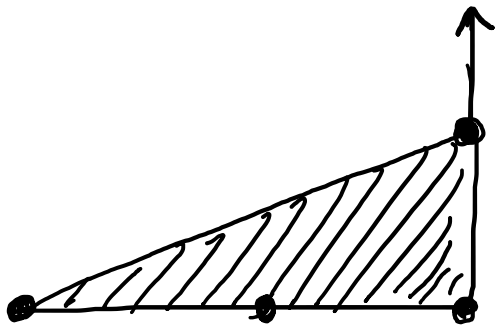
Method	MNLI-m	MNLI-mm	SNLI	SciTail	QNLI	RTE
ESIM + ELMo [44] (5x)	-	-	89.3	-	-	-
CAFE [58] (5x)	80.2	79.0	89.3	-	-	-
Stochastic Answer Network [35] (3x)	80.6	80.1	-	-	-	-
CAFE [58]	78.7	77.9	88.5	83.3		
GenSen [64]	71.4	71.3	-	-	82.3	59.2
Multi-task BiLSTM + Attn [64]	72.2	72.1	-	-	82.1	61.7
Finetuned Transformer LM (ours)	**82.1**	**81.4**	**89.9**	**88.3**	**88.1**	56.0

Table 3: Results on question answering and commonsense reasoning, comparing our model with current state-of-the-art methods.. 9x means an ensemble of 9 models.

Method	Story Cloze	RACE-m	RACE-h	RACE
val-LS-skip [55]	76.5	-	-	-
Hidden Coherence Model [7]	77.6	-	-	-
Dynamic Fusion Net [67] (9x)	-	55.6	49.4	51.2
BiAttention MRU [59] (9x)	-	60.2	50.3	53.3
Finetuned Transformer LM (ours)	**86.5**	**62.9**	**57.4**	**59.0**

Moving to BERT:

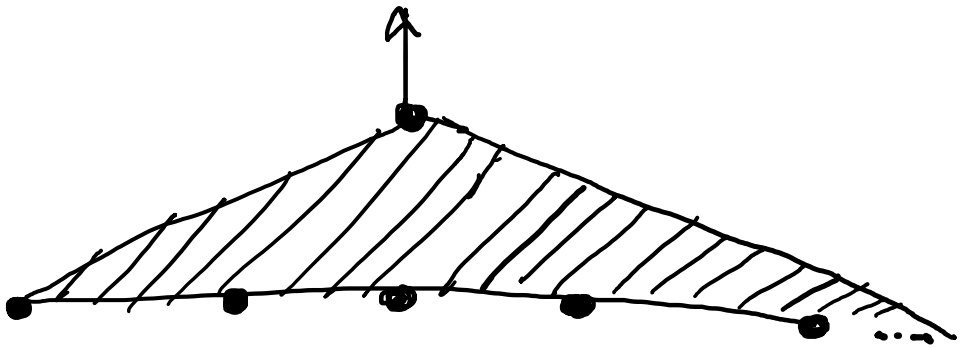
Self-attention



The cat sat on the ...

GPT

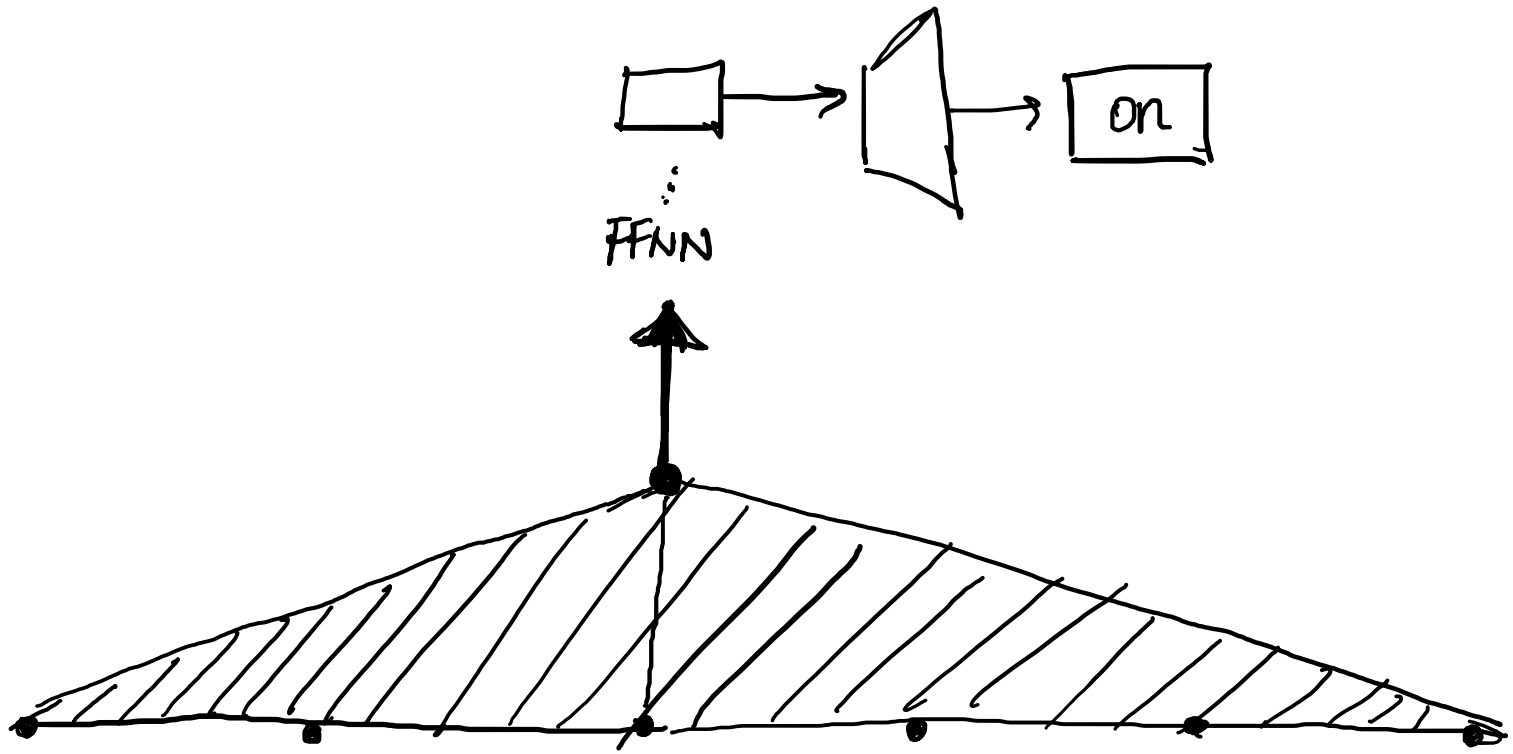
Masked self-attention



The cat sat on the ...

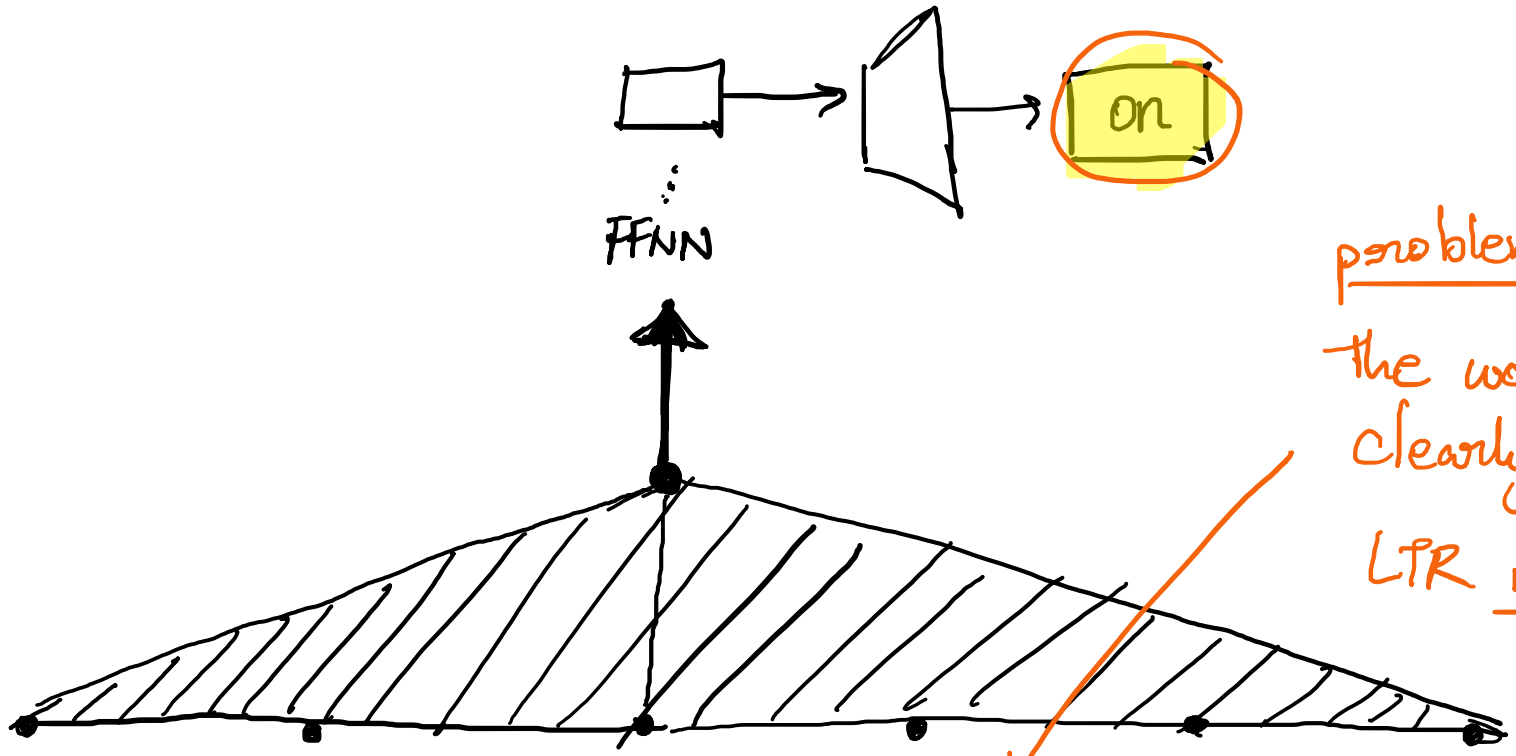
BERT

BERT: Stack encoders, not decoders!



The cat sat on the mat

BERT: Stack encoders, not decoders!



problem:

the word can clearly be seen!

LTR not a good pretraining objective.

The cat sat on the mat

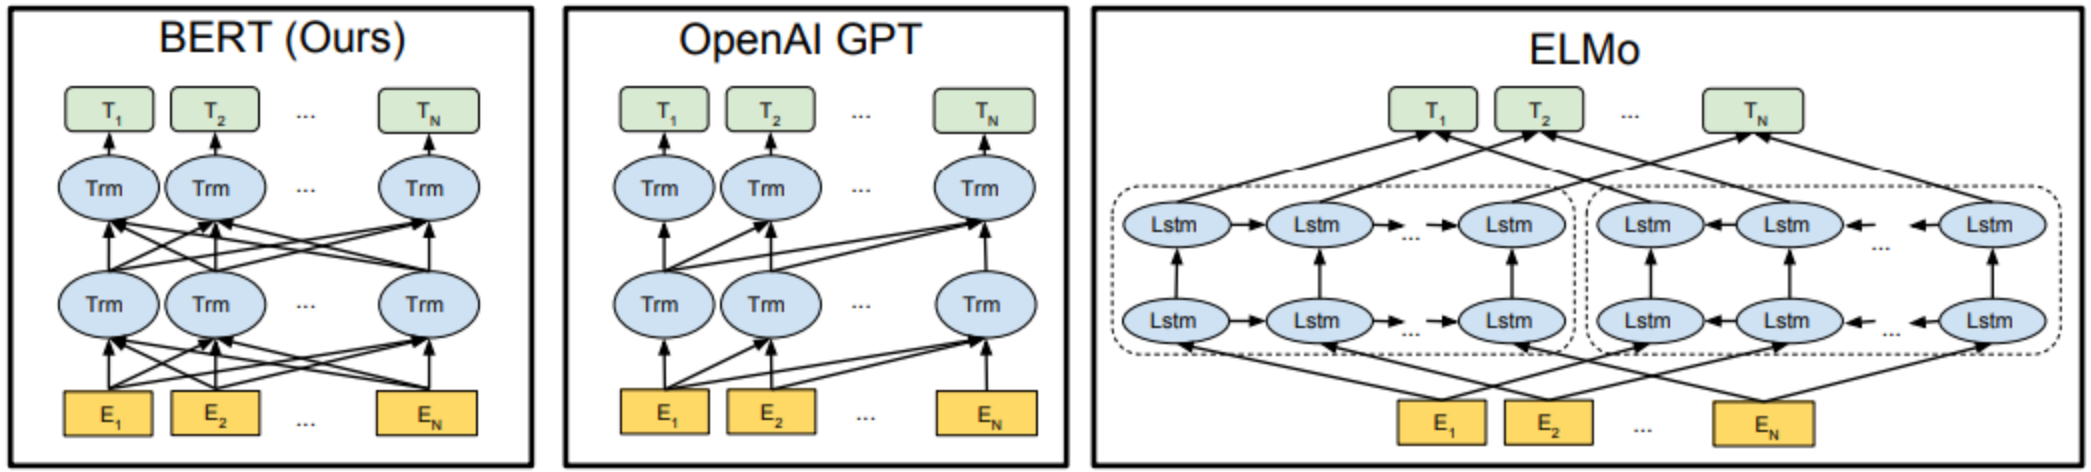


Figure 3: Differences in pre-training model architectures. BERT uses a bidirectional Transformer. OpenAI GPT uses a left-to-right Transformer. ELMo uses the concatenation of independently trained left-to-right and right-to-left LSTMs to generate features for downstream tasks. Among the three, only BERT representations are jointly conditioned on both left and right context in all layers. In addition to the architecture differences, BERT and OpenAI GPT are fine-tuning approaches, while ELMo is a feature-based approach.

BERT Pre-training objectives

1. Masked language model (MLM)

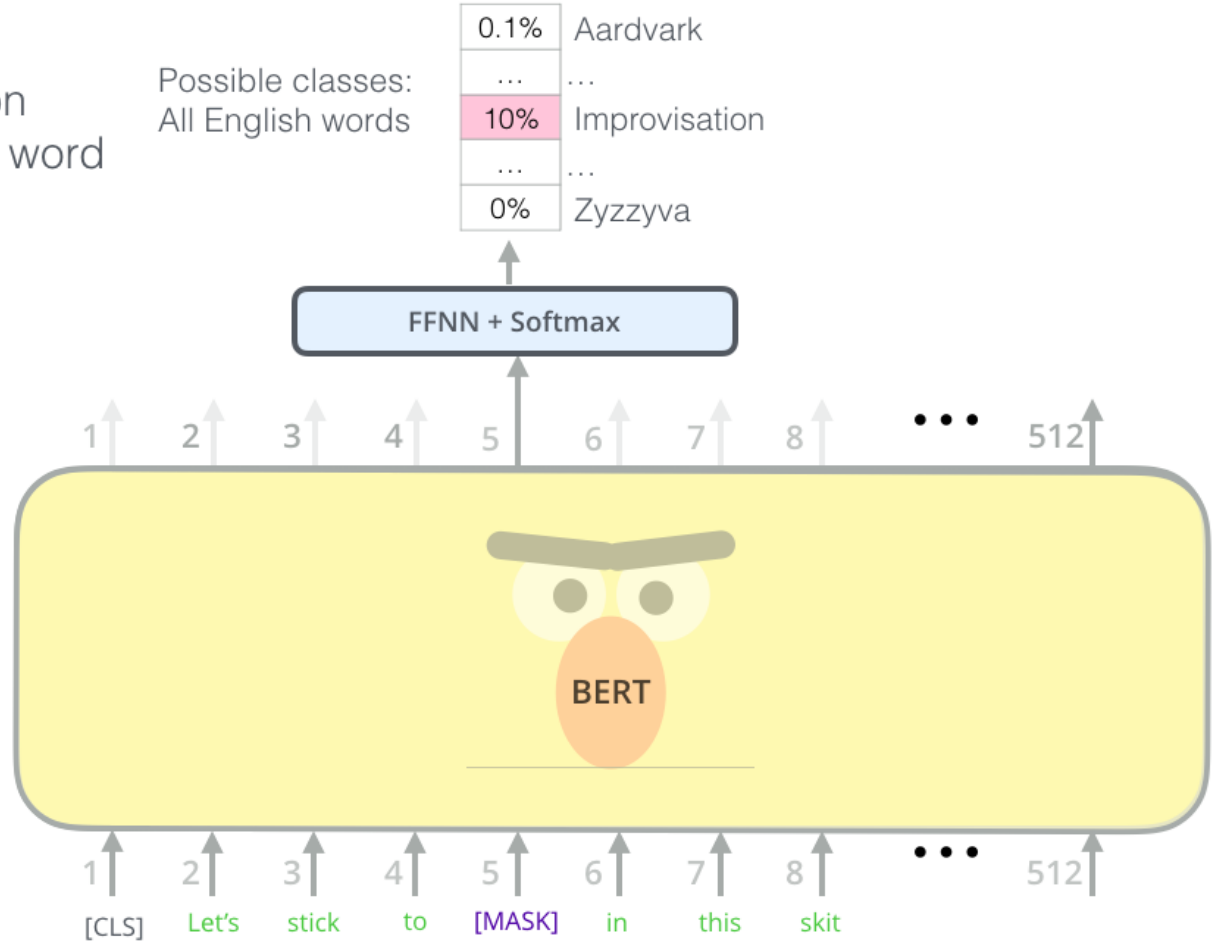
   Replace 15% words with [MASK] & predict them.

2. Next sentence prediction (NSP).

   Predict if sentence pair $\langle s_1, s_2 \rangle$ are a pair of adjascent sentences.

Masked Language Model.

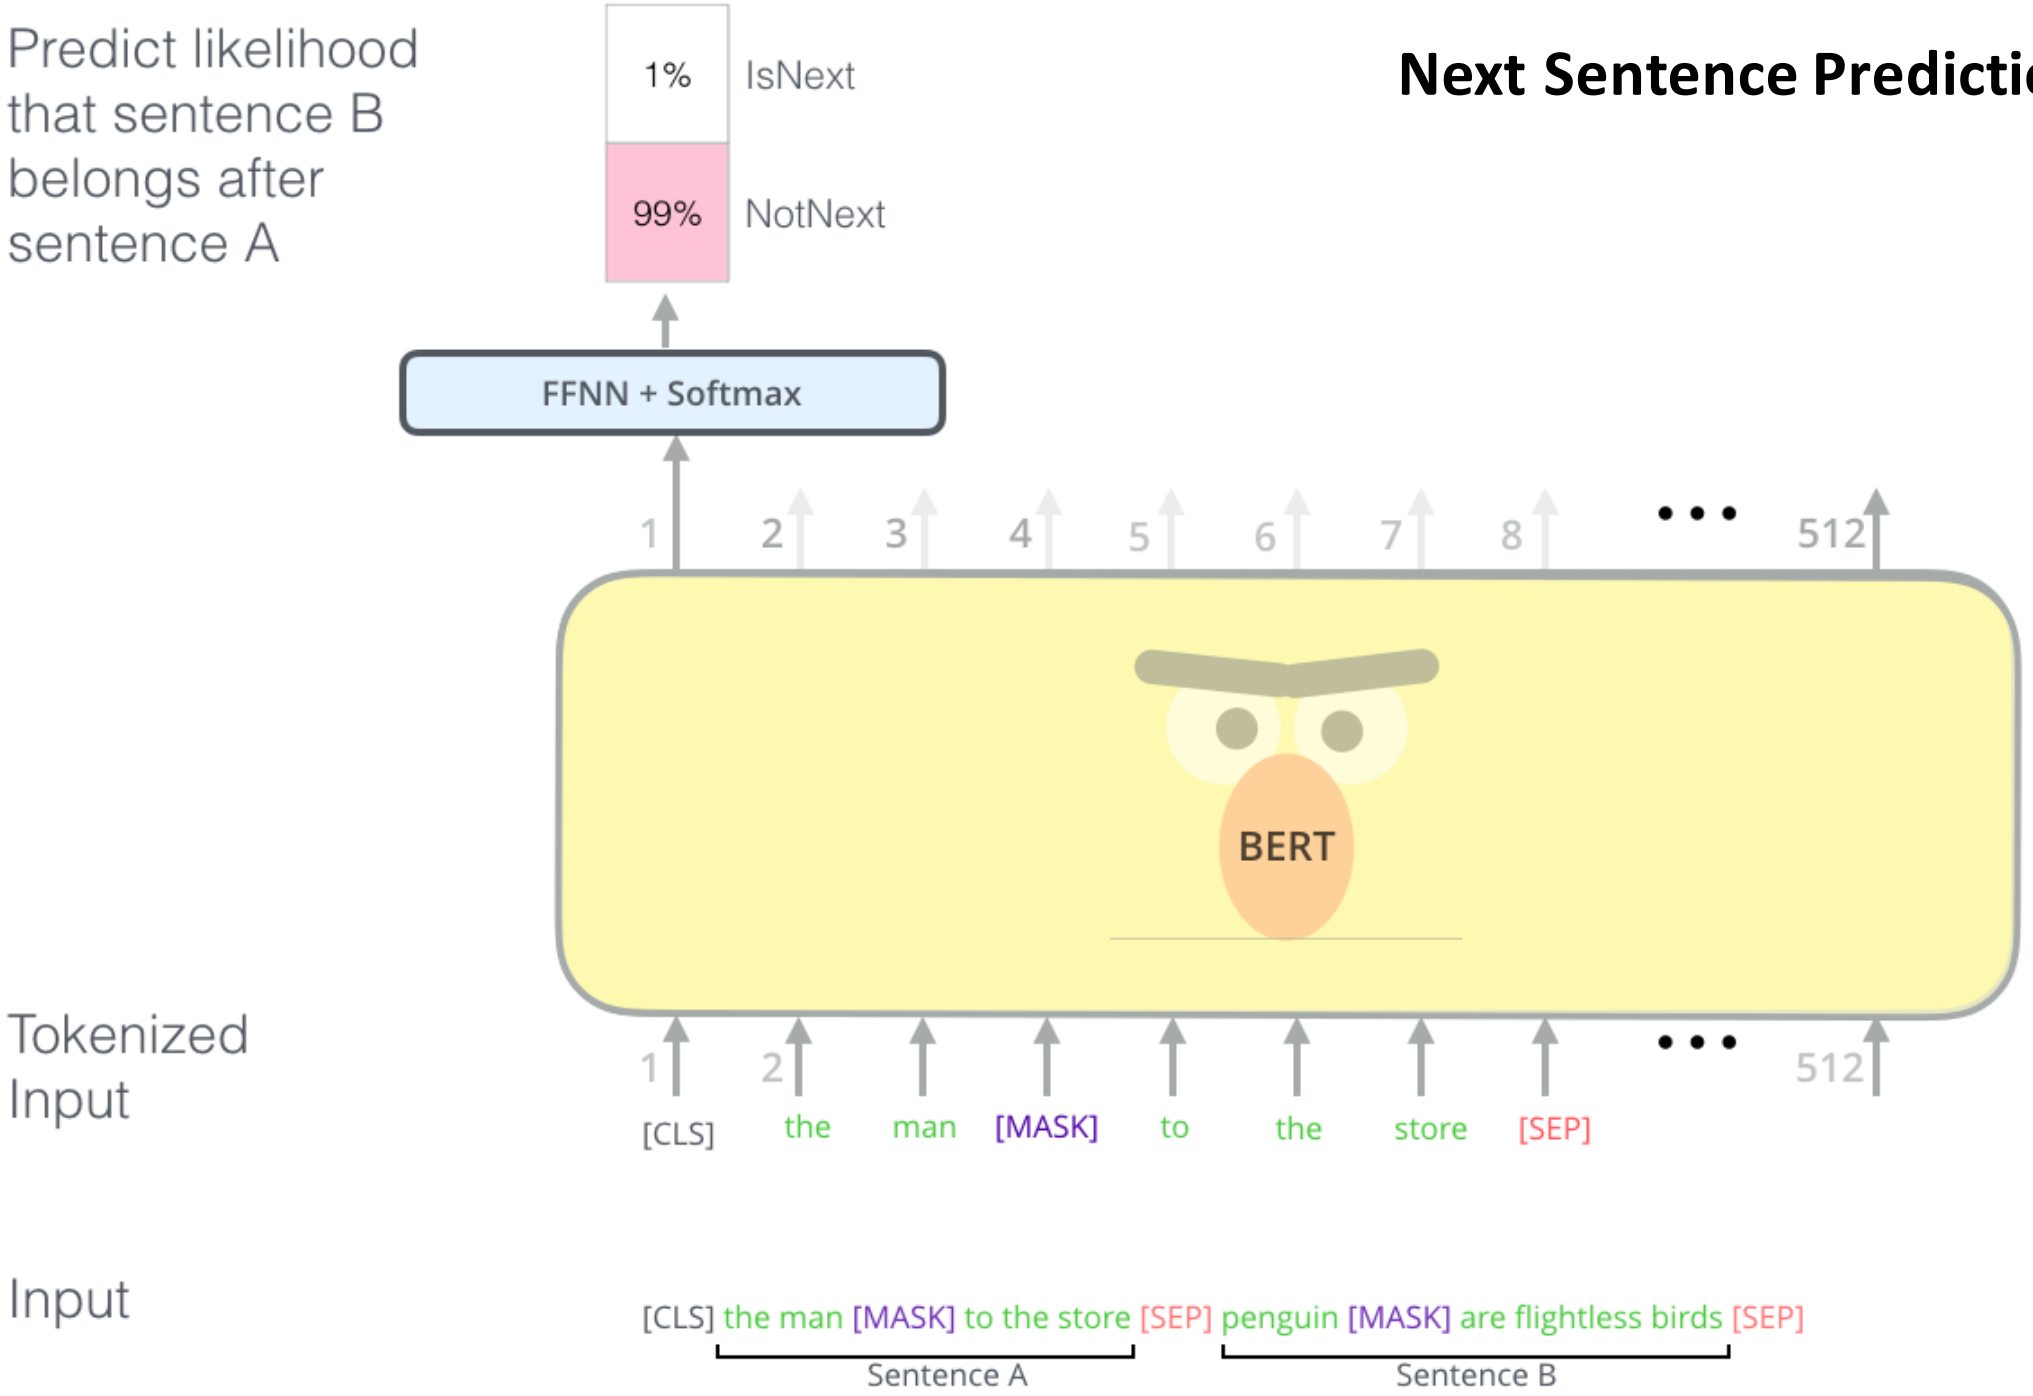
Use the output of the masked word's position to predict the masked word



Randomly mask 15% of tokens

Input

Next Sentence Prediction (NSP)



Sentence Encodings

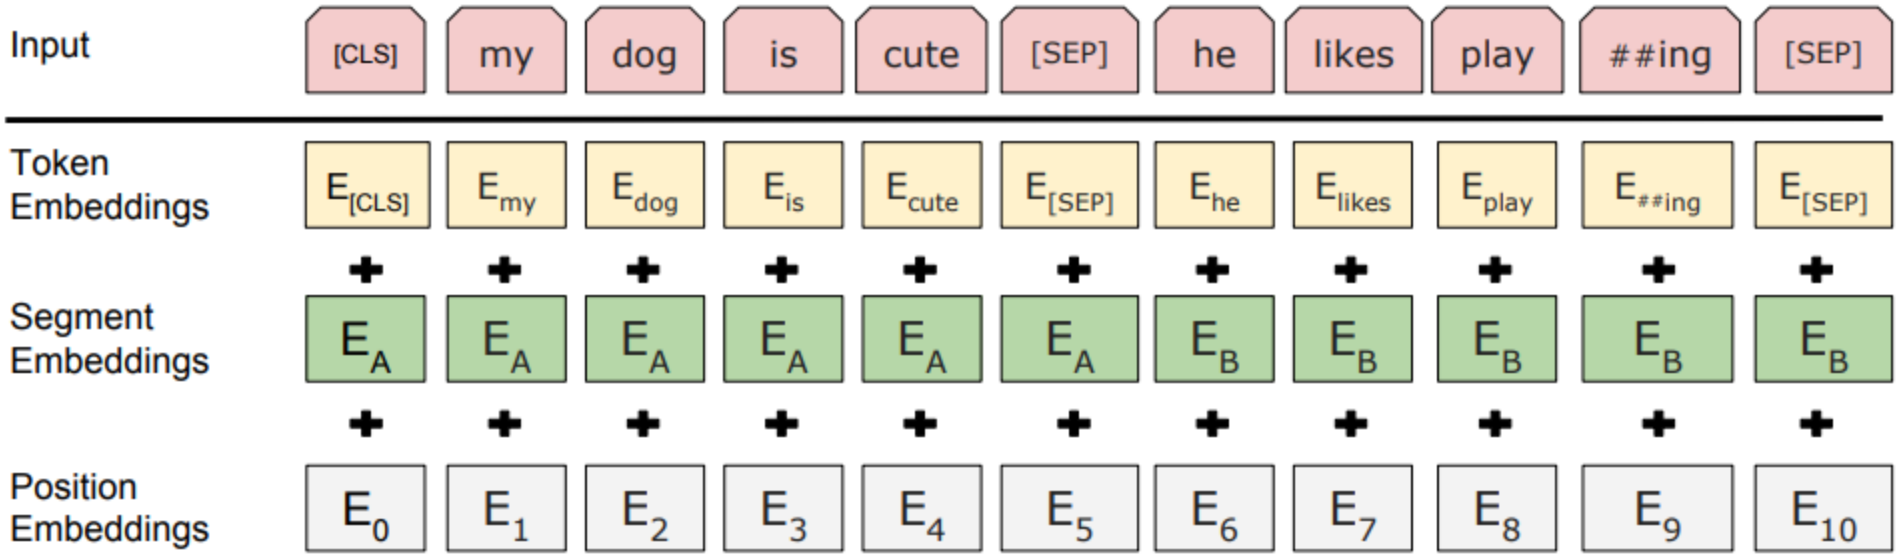


Figure 2: BERT input representation. The input embeddings are the sum of the token embeddings, the segmentation embeddings and the position embeddings.

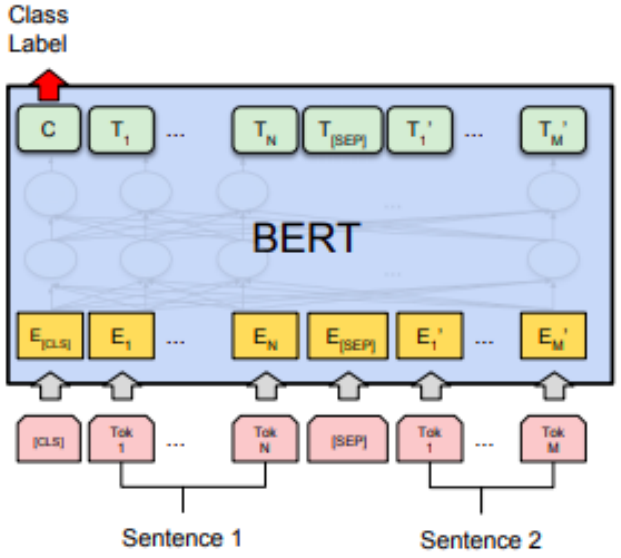
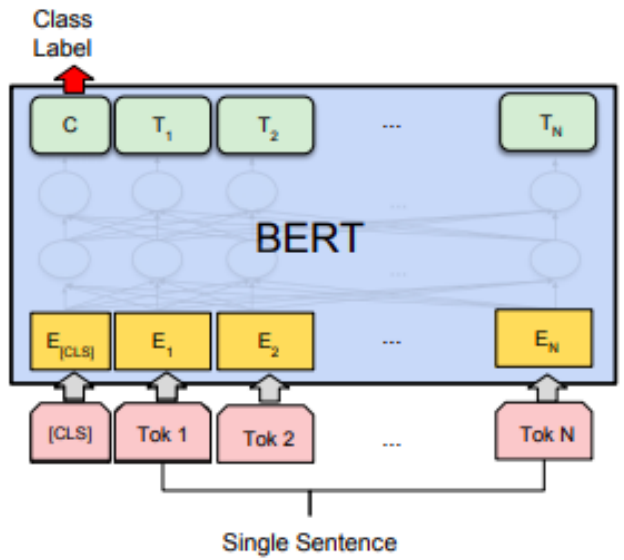
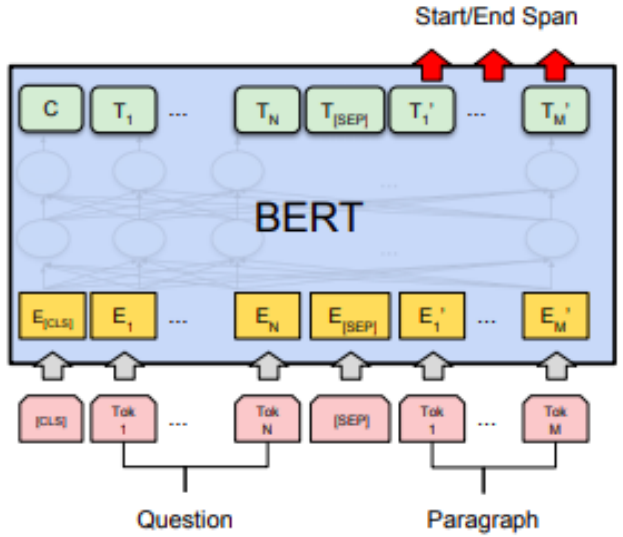
Task-specific Deployments



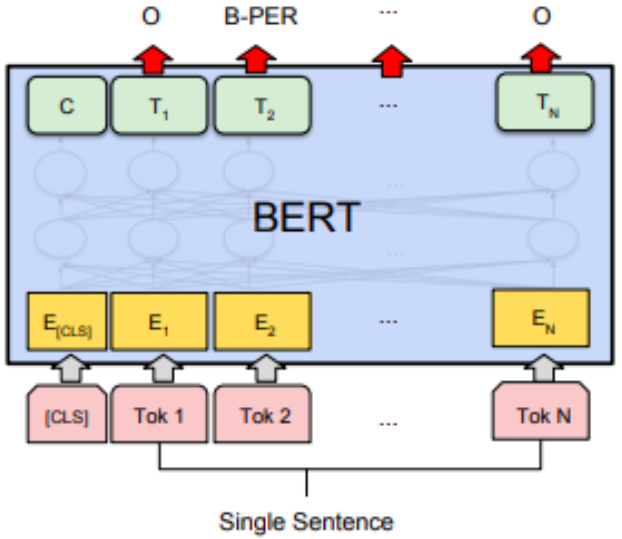
(a) Sentence Pair Classification Tasks: MNLI, QQP, QNLI, STS-B, MRPC, RTE, SWAG



(b) Single Sentence Classification Tasks: SST-2, CoLA



(c) Question Answering Tasks: SQuAD v1.1



(d) Single Sentence Tagging Tasks: CoNLL-2003 NER

System	MNLI-(m/mm) 392k	QQP 363k	QNLI 108k	SST-2 67k	CoLA 8.5k	STS-B 5.7k	MRPC 3.5k	RTE 2.5k	**Average** -
Pre-OpenAI SOTA	80.6/80.1	66.1	82.3	93.2	35.0	81.0	86.0	61.7	74.0
BiLSTM+ELMo+Attn	76.4/76.1	64.8	79.8	90.4	36.0	73.3	84.9	56.8	71.0
OpenAI GPT	82.1/81.4	70.3	87.4	91.3	45.4	80.0	82.3	56.0	75.1
$\text{BERT}_{\text{BASE}}$	84.6/83.4	71.2	90.5	93.5	52.1	85.8	88.9	66.4	79.6
$\text{BERT}_{\text{LARGE}}$	**86.7/85.9**	**72.1**	**92.7**	**94.9**	**60.5**	**86.5**	**89.3**	**70.1**	**82.1**

Table 1: GLUE Test results, scored by the evaluation server (https://gluebenchmark.com/leaderboard). The number below each task denotes the number of training examples. The "Average" column is slightly different than the official GLUE score, since we exclude the problematic WNLI set.[8] BERT and OpenAI GPT are single-model, single task. F1 scores are reported for QQP and MRPC, Spearman correlations are reported for STS-B, and accuracy scores are reported for the other tasks. We exclude entries that use BERT as one of their components.

System	Dev		Test

Table 4: SWAG Dev and Test accuracies. †Human performance is measured with 100 samples, as reported in the SWAG paper.

Ablation Study 1:

Without next sentence prediction,

Without bidirectional self-attention

Tasks	Dev Set MNLI-m (Acc)	QNLI (Acc)	MRPC (Acc)	SST-2 (Acc)	SQuAD (F1)
$\text{BERT}_{\text{BASE}}$	84.4	88.4	86.7	92.7	88.5
No NSP	83.9	84.9	86.5	92.6	87.9
LTR & No NSP	82.1	84.3	77.5	92.1	77.8
+ BiLSTM	82.1	84.1	75.7	91.6	84.9

Table 5: Ablation over the pre-training tasks using the $\text{BERT}_{\text{BASE}}$ architecture. "No NSP" is trained without the next sentence prediction task. "LTR & No NSP" is trained as a left-to-right LM without the next sentence prediction, like OpenAI GPT. "+ BiLSTM" adds a randomly initialized BiLSTM on top of the "LTR + No NSP" model during fine-tuning.

Ablation Study 1 (cot'd):

Without bidirectional self-attention

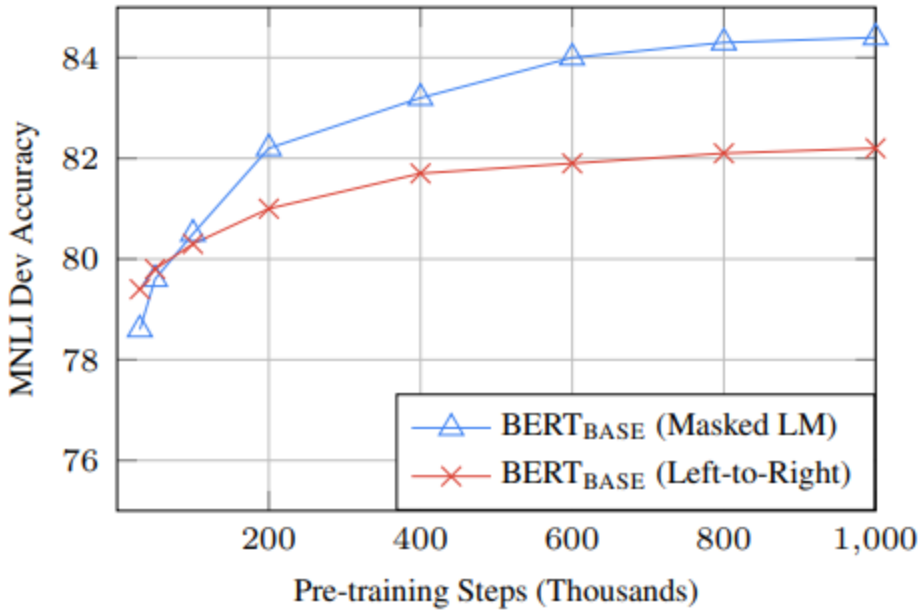

Figure 5: Ablation over number of training steps. This shows the MNLI accuracy after fine-tuning, starting from model parameters that have been pre-trained for k steps. The x-axis is the value of k.

Ablation Study 2:

Transformer model hyperparameters

Hyperparams				Dev Set Accuracy		
#L	#H	#A	LM (ppl)	MNLI-m	MRPC	SST-2
3	768	12	5.84	77.9	79.8	88.4
6	768	3	5.24	80.6	82.2	90.7
6	768	12	4.68	81.9	84.8	91.3
12	768	12	3.99	84.4	86.7	92.9
12	1024	16	3.54	85.7	86.9	93.3
24	1024	16	3.23	86.6	87.8	93.7

Table 6: Ablation over BERT model size. #L = the number of layers; #H = hidden size; #A = number of attention heads. "LM (ppl)" is the masked LM perplexity of held-out training data.

Ablation Study 3:
Masking strategy

Masking Rates			Dev Set Results		
MASK	SAME	RND	MNLI	NER	
			Fine-tune	Fine-tune	Feature-based
80%	10%	10%	84.2	95.4	94.9
100%	0%	0%	84.3	94.9	94.0
80%	0%	20%	84.1	95.2	94.6
80%	20%	0%	84.4	95.2	94.7
0%	20%	80%	83.7	94.8	94.6
0%	0%	100%	83.6	94.9	94.6

Table 8: Ablation over different masking strategies.

[In the main paper]
Of the 15% words (tokens) to be masked:

1. 80% are changed to [mask]
2. 10% are kept unchanged
3. 10% are replaced with a random word

This is done to reduce discrepancy between pre-training and task-specific data.

[Here]
We vary these ratios to check what helps.
